1.0 INTRODUCTION

MTE Consultants Inc. (MTE) was retained by Ferma Aggregates Inc. (Ferma) to assess the water supply potential and the hydraulic properties of the underlying bedrock at the Ferma-Carden Quarry. This information will be used to demonstrate that the quarry can extract below 255 masl in Phase 1, expand into remaining phases, and mitigate potential impacts to existing groundwater users by accessing a safe and reliable water supply from a separate deeper bedrock aquifer.

The Ferma-Carden Quarry is located on Lot 6-10, Concession 9, former geographic Township of Carden, City of Kawartha Lakes, ON (hereby referred to as the "Site"). Additionally, Ferma owns W ½ Lot 6 & 7 Concession 10 as well as Lot 8, Concession 10. **Figure 1** illustrates the Site location and the additional lands owned by Ferma.

This report is organized into the following sections:

- Section 1: Introduction – Provides background information, project scope and objectives;
- Section 2: Regional Bedrock Geology – Recaps the geological conditions of the Site by describing the Bobcaygeon Formation, the underlying Gull River Formation with its Green Marker Beds, and the deeper underlying Shadow Lake Formation/Precambrian contact zone;
- Section 3: Gull River Formation Green Marker Beds – Summarizes available information used to determine the elevation of the Green Marker Beds on a regional scale as well as a site-specific scale;
- Section 4: Hydraulic Testing Program – Presents the results of hydraulic testing completed on-Site for each bedrock zone;
- Section 5: Water Chemistry Assessment – Presents the results of groundwater sampling and analysis for each bedrock zone;
- Section 6: Discussion – General discussion of the physical and chemical properties of the bedrock formations and the implications for the Ferma-Carden Quarry;
- Section 7: Conclusions – Lists conclusions resulting from this assessment; and
- Section 8: Recommendations – Lists recommendations resulting from this assessment.

1.1 Objectives and Scope

The principle objectives of this assessment are to:

1. Establish a baseline understanding of the hydraulic condition (physical and chemical properties) of the different bedrock zones (Formations) with respect to water quality and quantity;
2. Provide information showing that the quarry can extract below 255 masl in Phase 1, and then into the remaining phases, provided potential impacts to existing groundwater users are mitigated as proposed; and
3. Demonstrate that a potable water supply of comparable water quality and quantity to what residents are currently utilizing is available at depths below 255 masl, which can be used to mitigate impacts to water supply wells permanently affected by quarry dewatering.

1.2 ARA Site Plan

The Ferma-Carden Quarry is licensed to extract bedrock under ARA License Number 108268 as a Category 2, Class A, Quarry Below Water. The approved ARA Site Plans are found in **Appendix A.** Based on the approved ARA Site Plan, the maximum depth of extraction for Phase 1 is 231 masl with a sump elevation of 228 masl. However, Dewatering Condition 1 states that:

> *The Permit to Take Water applies to dewatering the first lift of Phase 1, North Part, Ferma-Carden Quarry which is defined as limestone excavation limited to a depth elevation of 255.0 masl over the east half of lots 8 and 9, Concession IX, Carden Township. Subsequent lifts or Phases or greater pumping volumes will require a new Permit to Take Water.*

This condition limits the quarry floor to an elevation of 255 masl in Phase 1 until such time that a Permit to Take Water (PTTW) is issued for dewatering at deeper depths and subsequent phases. This condition was added to the Site Plan by the Ministry of the Environment Conservation and Parks (MECP) to mitigate potential impacts to nearby domestic well users (Trow Consulting Engineers Ltd., 2002).

To further protect domestic well users from potential impacts from dewatering the quarry, Condition 4A (Trigger Mechanism and Contingency Measures – Domestic Wells) states that:

> *The Operator will maintain a potable water supply source to surrounding wells adversely affected by dewatering operations. Contingency measures include, but not limited to, the use of holding tanks, the construction of a new wells(s) with the upper bedrock aquifer at a locations(s) unaffected by quarry dewatering and the delivery of water from the new wells(s) by pressurized pipe system to each affected residence. Dewatering mechanisms will be shut down failing the resolution of water supply problems caused by quarry dewatering.*

As previously mentioned, this report will provide information demonstrating that an alternative reliable potable water supply of comparable water quality and quantity is available at depths deeper than 255 masl, such that the quarry can provide affected residences a viable new well(s) in the event they are permanently affected by quarry dewatering.

2.0 REGIONAL BEDROCK GEOLOGY

The following is a description of the general bedrock geology of the Lake Simcoe Region as reported by the Geological Survey of Canada (GSC) and Ontario Geological Survey (OGS).

There are four bedrock units present in the Lake Simcoe Area. These include three sedimentary bedrock formations: the Bobcaygeon, the Gull River, and the Shadow Lake Formations, and one underlying metamorphic Precambrian gneiss. **Table 1** provides a general description of the lithology of these units as reported by the GSC.

Table 1: Regional Bedrock Lithology

System	Group	Formation		Lithology
ORDOVICAN	Simcoe	Bobcaygeon	Upper Member	Calcarenites and sublithographic limestone
			Middle Member	Sublithographic limestone
			Lower Member	Argillaceous limestone and calcarenite
		Gull River	Upper Member	Lithographic semicrystalline limestone

System	Group	Formation		Lithology
			Middle Member	Lithographic limestone
			Lower Member	Dolomitic limestone and lithographic limestone
CAMBRIAN	Basal	Shadow Lake		Red and green shale, arkose
PRECAMBRIAN				

2.1 Bobcaygeon Formation

The Bobcaygeon Formation is divided into three members. Essentially the lower member consists of grey, fine-grained limestone, but encloses calcarenite in its uppermost few feet. The middle member consists of sublithographic limestone. The upper member alternates between sublithographic and medium calcarenite limestone, but also includes some brown lithographic limestone and bluish fine-grained limestone in minor thicknesses. Shaley partings (up to 2 mm thick) have been observed in this formation. Shaley partings are commonly styolitic and occasionally undulating.

Contact

The lower contact of the Bobcaygeon Formation is defined where the typical grey-brown, fine- and medium-grained argillaceous limestone with shaley beds overlies the more finely grained dolomitic limestone of the Gull River Formation. This contact in many places is marked by a transitional boundary. The OGS defines this contact as the Moore Hill beds which are a dark brown fossiliferous limestone (Armstrong, 2000)

2.2 Gull River Formation

The Gull River Formation is divided into three members. The lower member consists of fine-grained limestone, lithographic limestone, and fine-grained dolomitic limestone. The middle member is composed almost entirely of lithographic limestone; the upper member lithographic, sublithographic, and semi-crystaline limestone.

Contact

The lower contact of the Gull River Formation is defined where the limestone and dolomitic limestone overlie the red and green shales of the Shadow Lake Formation. The upper contact is defined as the top of the highest development of lithographic limestone and argillaceous limestone of the Bobcaygeon Formation. On gross lithology, the Gull River Formation is a lithographic dolomitic limestone; and the Bobcaygeon Formation is a grey, fine-grained, argillaceous limestone.

The upper contact of the lower member of this Formation is marked in places by a green grey sandy dolostone horizon which is known as the “upper green marker bed”. A similar horizon near the bottom of the lower member is referred to as the “lower green marker bed”.

The contact between the Gull River Formation and the underlying Shadow Lake Formation is gradational from carbonate to sandstone and shale. It is convenient to define this contact as the uppermost extent of the gradation because of the deleterious effects of the sandstone and shale content on the potential aggregate quality of the Gull River Formation (Armstrong, 2000).

2.3 Shadow Lake Formation

The Shadow Lake Formation consists of greenish grey, coarse-grained, calcareous arkose overlain by several feet of red and green arenaceous shales. The shales are locally calcareous and commonly contain frosted, rounded to angular quartz grains that are as much as 1.25 cm long. The formation also includes some transitional red mottled green shale. Where the Cambrian formations are present, the Shadow Lake Formation may include reworked Cambrian sediments, such as purplish sandstone and shale. In well cuttings the formation appears to be more arkosic and sandy (with greenish and reddish shale fragments) than it actually is, because the softer shale is washed away by the drilling mud.

Contact

The upper contact of the Shadow Lake Formation is defined where the main shale section of the Shadow Lake Formation is overlain by the limestone sequence of the Simcoe Group. The lower member of the Gull River Formation consists of grey and brown, fine- and medium-grained limestone and dolomitic limestone, and grey and brown, dense, sublithographioc to lithographic limestone (Armstrong, 2000).

3.0 GULL RIVER FORMATION GREEN MARKER BEDS

Over the past 30 years several studies have been undertaken to characterize the lithology of the Carden Plain, and in particular the presence and elevations of the “Green Marker Beds” located in the Gull River Formation. The Green Marker Beds have been of particular interest as they reportedly represent a regionally extensive aquifer that although being relatively thin (1-3 m) represents a significant transmissive layer (Golder Associates, 2012). In an effort to document the presence of the Green Marker Beds in the vicinity of, and beneath the Site, MTE has reviewed a number of pertinent documents, including:

- Cumulative Impacts Assessment for Groundwater Takings in the Carden Plain Area (Golder Associates, 2012);
- R.W. Tomlinson Ltd. – Brechin Quarry borehole and borehole geophysical logs (Golder Associates, 2009);
- Hydrotechnical Report Ferma – Carden Quarry for Ferma Crushed Stone Inc. (Oliver, Mangione, McCalla & Associates Ltd., 1995);
- Well records on file with the MECP for boreholes drilled in 2006;
- Two borehole core logs, logged by MTE in 2011; and
- On-Site geophysical logs completed in 2018.

3.1 Regional Scale Model – Golder, 2016

In 2012, Golder developed a regional scale groundwater model to assess the cumulative impacts of pumping from the various quarries within the Carden Plain. MTE specifically reviewed the regionally modelled surface of the Upper Green Marker Bed (UGMB) as presented in the Addendum report to the Cumulative Impacts Assessment for Groundwater Takings in the Carden Plain Area (Golder Associates Ltd., 2016). This report showed the UGMB from approximately 235 to 245 mAMSL across the Site (**Appendix B**). This regional scale model is useful in roughly predicting the elevations of the GMBs, but lacks local scale data to calibrate the findings and is therefore only useful in a general sense.

3.2 Green Marker Bed Identification - Golder, 2009

To further understand the geology and hydrogeology of the Carden Plain, and to place the Ferma Quarry in the regional context, MTE made a Freedom of Information (FOI) submission (ref: A-2018-05968) to the MECP for information related to hydrogeology and geophysics for the R.W. Tomlinson – Brechin Quarry, located approximately 11 km to the southwest of the Site.

The FOI request returned borehole and geophysical logs from monitoring wells installed at the Brechin Quarry (**Appendix C**). Each location was geophysically logged for natural gamma and conductivity.

A review of the borehole and geophysical logs from the R.W. Tomlinson Brechin Quarry showed that the locations of the UGMB and Lower Green Marker Bed (LGMB) could be identified based on geophysical logs. Specifically, it was found that increased gamma values within the Gull River Formation correlated well with the location of both the UGMB and LGMB. These results were then compared with visual observations of the core to confirm the correlation between increased gamma values and the presence of the Green Marker Beds.

The borehole logs presented in **Appendix C** indicate that the UGMB ranges in thickness from 0.1 to 0.3 m while the LGMB thickness was observed to range from 0.4 to 1.4 m in thickness. The UGMB was found to occur approximately 3.4 to 3.9 m below the Bobcaygeon and Gull River Formation contact while the LGMB occurred generally 8.0 m below the UGMB.

3.3 On-Site Borehole Logs - Oliver, Mangione, McCalla, 1993 – 1995, MECP Well Logs, 2006 & MTE 2011

In 1993, a bedrock core from BH4 was logged by Oliver Mangione McCalla & Associates Ltd. (**Appendix D**) located 224 m south of the Phase 1 at the Site (Oliver, Mangione, McCalla & Associates Ltd., 1995). The log provided by Oliver Mangione McCalla & Associates noted a greenish grey to dark greenish grey silty to sandy dolostone layer at approximately 27.8 metres below ground surface, or approximately 239.8 mAMSL. This layer is interpreted by MTE to be the UGMB. According to the borehole log the UGMB had an approximate thickness of 0.7 m. Another greenish grey to dark greenish grey silty to sandy dolostone layer (interpreted by MTE to be the LGMB) was noted to occur at 231.3 mAMSL and based on the borehole log is approximately 3.0 m thick.

In 2006, six multi-level monitoring wells were installed on-Site (WA, WB, WF, WG, WH & WI), as shown on **Figure 2**. Well logs on file with MECP for these boreholes are provided in **Appendix E**. The presence of green limestone was noted at various depths, which MTE interprets to be the approximate depths of the Green Marker Beds. The UGMB was found to generally dip from northeast to southwest across the Site, occurring at an elevation of approximately 244.3 mAMSL in the north to 233.2 mAMSL in the south. The LGMB was only discreetly observed in three boreholes (WA, WB & WI) and occurred at an approximate elevation of 233.0 to 234.0 mAMSL.

In 2011, MTE retained Marathon Drilling to conduct borehole coring at two locations: BH1-11, located 47 m north of Phase 1, and BH2-11, located 176 m southwest of Phase 1, as identified on **Figure 2**, to assess the rock quality for use as aggregate products. MTE has recently re-examined the borehole and photographic logs for the presence of the Green Marker Beds. Borehole logs and photographic logs for BH1-11 and BH2-11 can be seen in **Appendix F**. Based on the borehole logs from on-Site monitoring wells, MTE interprets the UGMB to occur at approximately 243.0 mAMSL (Photograph 1.1) in BH1-11 and 237.8 mAMSL (**Appendix F**: Photograph 2.1) in BH2-11. The LGMB was interpreted to occur at an approximate elevation of 230.4 mAMSL (Photograph 1.2) in BH1-11 and 225.4 mAMSL (Photograph 2.2) in BH2-11.

3.4 On-Site Geophysical Logs - MTE, 2018

In 2018, MTE retained Lotowater Technical Services to conduct geophysical logging on two deep, open boreholes (W22 & MW4) on-Site. Based on the information obtained from the Golder Report (i.e. increased gamma readings correlated to the Green Marker Beds), MTE reassessed the previously published logs for W22, located approximately one kilometer south of Phase 1 and MW4, located 1.2 km east of Phase 1. Based on this reassessment, the UGMB is estimated to be located at an elevation of approximately 238.5 mAMSL in W22 and 247.0 mAMSL in MW4, (**Figure 3 and 4**). The LGMB was estimated to be located at approximately 231.5 mAMSL in W22 and 239.0 mAMSL in MW4.

3.5 On-Site Elevations of the Green Marker Beds

In order to interpret and present the information discussed above, MTE prepared two cross sections across the Site at the locations shown on **Figure 2.** The cross-sections show the interpreted elevations for the UGMB and LGMB (**Figures 5 and 6**).

4.0 HYDRAULIC TESTING PROGRAM

4.1 March 2022 Hydraulic Testing

Hydraulic testing undertaken in March 2022 was completed by W.D. Hopper and Sons Ltd. (Hopper) to assess the hydraulic properties of the underlying bedrock, particularly the Gull River Formation Green Marker Beds at the Ferma-Carden Quarry. The hydraulic testing program was completed in accordance with Environmental Activity and Sector Registration (EASR) No. R-011-7169340455 and the Pumping Test Design Report completed by MTE dated March 10, 2022 (**Appendix G**).

The objective of the hydraulic testing program was to document the hydraulic properties of each of the bedrock formations including the Bobcaygeon Formation, the Gull River Formation Upper and Lower Green Marker Beds, and the Shadow Lake Formation / Precambrian contact zone.

In order to determine the hydraulic properties of the underlying bedrock zones, hydraulic testing was undertaken at MW3 and MW4. The details of these locations are described below.

Monitoring well MW3 is a 0.15 m dia, 20 m deep open borehole extending from 6 to 20 m below grade and was designed to represent a typical domestic well in the area, the majority of which are completed in the Bobcaygeon Formation (see Well Tag No.: A238596 in **Appendix E**).

MW4 is completed as a 0.20m dia, 40.8 m deep open borehole extending from 3 m to 40.8 m below ground level. This well was designed to extend from the Bobcaygeon Formation to the Pre-Cambrian bedrock contact (see Well Tag No.: A238597 in **Appendix E**).

The following section describes the results of the hydraulic testing program.

4.2 Bobcaygeon Formation (Zone 1)

In order to assess the hydraulic conductivity of the Bobcaygeon Formation (Zone 1) monitoring well MW3 was pumped at a constant rate of 130 L/min for a period of 60 min on March 17, 2022.

Water levels were recorded in MW3 during the pumping and recovery periods using a datalogger (see **Hydrograph 1**). Based on the analysis of the recovery data, the hydraulic conductivity (K) of Zone 1 as measured in MW3 was 2.2×10^{-6} m/s, with a transmissivity (T) of 3.9×10^{-5} m^2 /day and a storativity of 6.0×10^{-2}.

In order to document the water quality of the Zone 1, water samples were collected from the water discharged from MW3 after approximately 30 min of pumping and analyzed for general water quality parameters. Water quality results are further discussed in **Section 6.0**.

4.3 Upper Gull River Formation (Zone 2)

In order to assess the hydraulic characteristics of the Gull River Formation at the MW4 location, the geophysical logs for MW4 were reviewed (**Figure 4**). Based on a review of the geophysical logs MTE identified the presence of the Upper Green Marker Bed within Zone 2.

As part of this program, and in order to assess the hydraulic properties of the Upper Gull River Formation including the UGMB (Zone 2), on March 16, 2022 inflatable straddle packers were placed in the open MW4 borehole at depths of 21.6 m bgl and 32.9 m bgl with a submersible pump and datalogger installed in between. The straddle packers were designed to effectively isolate Zone 2 by sealing off the underlying Lower Gull River (including the Lower Green Marker Bed), Shadow Lake Formation and Precambrian contact zone from the overlying Bobcaygeon Formation, while allowing Zone 2 to be pumped separately. The placement of the packers are illustrated on **Figure 7** and the temporary well modifications and pumping was completed by Hopper, licensed well technicians.

To assess the productivity of Zone 2, an initial pumping rate of 40 L/min was chosen. After 1-2 minutes of pumping, this pumping rate was not able to be sustained. Through trial and error, a constant pumping rate of 8 L/min was achievable while maintaining the pumping level at a safe level above the pump intake to avoid cavitation and allow for suitable cooling while pumping. The results of these pumping activities are shown on **Hydrograph 2**.

Based on an analysis of the recovery data from the pumping activities, the Hydraulic Conductivity (K) and Transmissivity (T) and Storativity (S) of Zone 2 at the MW4 location was determined to be 6.7×10^{-7} m/s, 6.5×10^{-5} m^2 /day and 6.8×10^{-3} respectively.

In order to document the water quality of the Zone 2, water samples were collected on March 16, 2022 from the water discharged from the pumped isolated zone after approximately 40 min of pumping and analyzed for general water quality parameters. Water quality results are further discussed in **Section 6.0**.

4.4 Lower Gull River Formation / Shadow Lake Formation / Precambrian Contact Zone (Zone 3)

In order to assess the hydraulic characteristics of the Lower Gull River Formation / Shadow Lake Formation / Precambrian Contact zone at the MW4 location, the geophysical logs for MW4 were reviewed (**Figure 4**). Based on a review of the geophysical logs MTE identified the presence of the LGMB within Zone 3.

As part of this program, and in order to assess the hydraulic properties of the Lower Gull River Formation including the LGMB / Shadow Lake Formation / Precambrian Contact zone (Zone 3), on March 14, 2022 an inflatable packer was placed in the open MW4 borehole at a depth of 32.9 m bgl with a submersible pump and datalogger placed below. The packer was designed to effectively isolate Zone 3 by sealing off the overlying Zones 1 & 2, while allowing Zone 3 to be pumped separately. The placement of the packers are illustrated on **Figure 8** and the temporary well modifications and pumping was completed by Hopper licensed well technicians. Once the packer was in place water levels in the overlying open borehole representing Zones 1 & 2 and the isolated Zone 3 were monitored prior to pumping. Based on the manual measurements taken prior to pumping test in Zone 3, the vertical water level separation between Zones 1 & 2 and Zone 3 was in the order of 1 m higher, indicative of a downward vertical hydraulic gradient.

The hydraulic testing plan was to conduct a short term variable rate step test in order to assess the specific capacity and yield of Zone 3, while allowing for an assessment of the optimal rate for a longer term constant rate test. Based on the documented pumping rate on the Water Well Record for MW4 (ie. 300 gpm, see **Appendix E**), this zone was anticipated to have a high production capability.

4.4.1 Variable Rate Step Test

On March 14, 2022, the Zone 3 portion of MW4 was pumped at rates of approximately 190 L/min, 380 L/min and 570 L/min sequentially for periods of 30 minutes, separated by 30 minute periods of recovery.

Based on the results of the pumping, the specific capacity of each pumping rate was 826 L/min/m, 655 L/min/m and 532 L/min/m respectively.

With an additional 34 m of available drawdown after the end of pumping of the third step, along with the high specific capacity values measured, this pumping confirmed that Zone 3 is a highly productive water producing zone at this location. Water levels in the pumped zone were measured on a continual basis using dataloggers and are shown on **Hydrograph 3**.

4.4.2 Constant Rate Pumping Test

Based on the results of the variable rate step test, on March 15, 2022, Zone 3 at MW4 was pumped at a constant rate of 570 L/min for a period of 8 hrs in order to document the results of sustained pumping at a relatively high yield and enable the collection of water samples for chemical analysis. The hydrograph displaying the water levels collected during this test are shown on **Hydrograph 4**.

Based on an analysis of the recovery data from the pumping activities, Hydraulic Conductivity (K), Transmissivity (T) and Storativity (S) of the Lower Gull River / Shadow Lake / Precambrian Contact zone at the MW4 location were determined to be 4.8×10^{-5} m/s, 3.1×10^{-4} m^2 /day and 7.7×10^{-6} respectively.

In order to document the water quality of Zone 3, water samples were collected on March 15, 2022 from the water discharged from the pumped isolated zone after 70 minutes and 450 minutes of pumping and analyzed for general water quality parameters. Water quality results are further discussed below in **Section 5.0**.

5.0 MULTI-LEVEL WELL INSTALLATION

5.1 W22

Per Condition 4.4 of PTTW 238-BBLKNE on November 30, 2021 W22 was completed as a multi-level well by Hopper. W22 was completed as two discreetly screened monitoring wells referred to as W22a and W22b. W22a and W22b were constructed using 0.04 m diameter schedule 40 PVC piping equipped with a 3 m length No. 10 slot well screen. Borehole logs indicating the screened elevations of W22a and W22b can be found in **Appendix H**. W22b was completed within the Gull River Formation between the Upper and Lower Green Marker Beds while W22b was completed across the contact between the Bobcageon and Gull River Formations above the Upper Green Marker Bed.

Following well development both W22a and W22b had a data logger installed to allow for groundwater levels within these wells to be tracked continually on an hourly basis. Manual water level measurements and continuous data logger data can be seen on **Hydrograph 5**. A review of the water level data indicates that water levels in W22b follow a similar trend to other

monitoring wells completed other on-Site monitoring wells. However, groundwater levels in W22a appear to still be recovering since the well was developed in December 2021. The lack of recovery to static conditions within W22a indicates an area of low hydraulic conductivity within the Upper Gull River Formation.

5.2 MW4

Per Condition 4.4 of PTTW 238-BBLKNE on January 18th, 2024, MW4 was completed as a multi-level well by Hopper. MW4 was completed as two discreetly screened monitoring wells referred to as TW4-24 and MW4a. TW4-24 was constructed using 0.14 m diameter steel casing with a 6.1 m long continuous stainless steel wire wrapped 100 slot well screen. MW4a-24 was constructed using 0.03 m schedule 40 PVC piping equipped with a 1.5 m length No. 10 slot well screen. Borehole logs and an As-Constructed drawing indicating the screened elevations of MW4a-23 and TW4-24 can be found in **Appendix H**. Well screen intervals were based on geophysical data and hydraulic testing data collected in 2022.

MW4 was left an open borehole between 34.1 mbgs and 41.5 mbgs, this depth relates to Zone 3. Zone 3 was hydraulically isolated using a combination of shale traps and bentonite pellets up to a depth of 23.7 mbgs where a 0.5 m layer of #2 gravel was placed. Between 23.3 mbgs and the surface MW4 was left as an open borehole which corresponds to the Bobcageon Formation (Zone 1). Photos taken during the installation of TW4-24 and MW4a can be seen in **Appendix I**.

Following the installation of TW4a-24 On January 18, 2024 a well yield test was completed on January 19, 2024. The well yield test was also used to verify the water quantity, quality and that TW4-24 (Zone 3) had been hydraulically isolated from MW4a-24 (Zone 1). The well yield test took place over approximately 66 minutes. TW4-24 was pumped at 113 L/min for approximately 20 minutes before increasing to 416 L/min for the remainder of the test. A water quality sample from the discharge water was collected to compare to previous obtained water quality results. Water levels from TW4-24, MW4a-24 and MW3 during the well yield test can be seen on **Hydograph 6**. As can be observed on **Hydrograph 6** groundwater levels in both MW4a-24 and nearby MW3 were not impacted as a result of pumping from TW4-24 thereby verifying that TW4-24 had successfully been hydraulically isolated from those wells completed in Zone 1.

6.0 WATER CHEMISTRY ASSESSMENT

6.1 Results – ODWS Compliance

The following section presents the results of groundwater sampling and analysis collected from the underlying bedrock zones as defined in **Section 4**. The water quality results are compared to each other and the Ontario Drinking Water Standards. A summary of the water quality results from the different zones has been presented in **Table 2**.

6.1.1 Bobcaygeon Formation (Zone 1)

The groundwater sample collected from Zone 1 was within the chemical standards for the ODWS. MTE noted an aesthetic exceedance for iron in the sample obtained from Zone 1, however iron is not considered a health concern.

6.1.2 Upper Gull River Formation (Zone 2)

The groundwater sample collected from Zone 2 was within the chemical standards for the ODWS with the exception of a minor exceedance for lead (0.014 mg/L vs. 0.01 mg/L). MTE also noted an aesthetic exceedance for iron and manganese in the sample obtained from Zone 2, however both iron and manganese are not considered a health concern.

6.1.3 Lower Gull River / Shadow Lake / Precambrian Contact Zone (Zone 3)

The groundwater samples collected from Zone 3 during the 2022 Hydraulic Testing and during the well yield test in 2024 were within the chemical and health standards for the ODWS. MTE notes the water quality results of the 2024 groundwater samples were comparable to the 2022 samples.

Exceedances of aesthetic guidelines for colour, hardness, and turbidity were noted in samples collected from bedrock Zones 1, 2 & 3, however aesthetic guidelines and are not health related.

Additionally, no hydrocarbons were detected in samples collected from Zone 1, 2 or 3.

6.2 Geochemical analysis

This section compares the results of the geochemical analysis of the groundwater samples to determine similarities/differences between the geochemical signatures of the three bedrock zones that were pumped.

Geochemical analysis of the groundwater samples from each of the respective bedrock zones (i.e. Zone 1, Zone 2 and Zone 3) was undertaken to determine similarities between the geochemical signature of the different bedrock zones. For visualization purposes the geochemical results of the major ionic species (Na^+, K^+, Ca^{2+}, Mg^{2+}, Cl^-, CO_3^{2-} + HCO_3^-, and SO_4^{2-}) have been plotted on a trilinear diagram (Piper, 1944) as percent composition of each cation or anion (**Figure 9**). For the purposes of this report CO_3^{2-} + HCO_3^- has been plotted as measured alkalinity. As shown on **Figure 9** groundwater samples from each of the three respective zones plot in a very similar location on the trilinear plot, which indicates comparable water quality between bedrock zones.

7.0 DISCUSSION

7.1 2022 Hydraulic Testing Compared to Historical Data

In addition to the results of the hydraulic testing presented herein, MTE also reviewed hydraulic conductivities (K) from previous reports for the Ferma-Carden Quarry, as well as other quarries within the Carden Plain. The following sections compare the K-values presented herein to the those calculated from historical on-Site testing, as well as from the Golder, 2012 report, with the purpose of corroborating the reported hydraulic conductivities for Zone 1, 2 and 3 presented above.

7.1.1 Bobcaygeon Formation (Zone 1)

In a report prepared by MTE under separate cover titled “Ferma Aggregates Inc. – Carden Quarry Zone of Influence Assessment Category 3 PTTW Application Lot 6-10, Concession 9, Carden Township, City of Kawartha Lakes, ON”, dated January 5, 2018, MTE estimated the hydraulic properties of the Bobcaygeon Formation, in which the Ferma-Carden Quarry is being extracted. Based on a review of this report, the Hydraulic Conductivity (K) and Transmissivity (T) of the Bobcaygeon Formation at the active quarry location were reported as 3.0×10^{-5} m/s and 39 m^2 /day respectively.

The Golder Associates 2012 Report summarized hydraulic conductivity data from 12 quarries within the Carden Plain, reporting the geometric mean hydraulic conductivity of the Bobcaygeon Formation was 5.3×10^{-8} m/s.

Further, on-Site testing conducting previously (1995) indicates the hydraulic conductivity within the Middle Bobcaygeon generally ranged from 10^{-5} m/s to 10^{-7} m/s with one notable outlier of 10^{-9} m/s (Oliver, Mangione, McCalla & Associates Ltd., 1995).

The Table below summarizes the hydraulic conductivity values of the Bobcaygeon Formation based on on-Site testing and the 2012 Golder Report.

Source	Hydraulic Conductivity
Ferma-Carden Quarry (Oliver, Mangione, McCalla & Associates Ltd., 1995)	10^{-5} m/s to 10^{-7} m/s
Quarries analyzed as part of the 2012 Golder Report	5.3×10^{-8} m/s
Ferma-Carden Quarry (MTE Consultants Inc., 2018)	3.0×10^{-5} m/s
Ferma-Carden Quarry Pumping Test, MTE Consultants Inc., 2022	2.2×10^{-6} m/s

It is MTE's opinion that the hydraulic conductivity values calculated based on MTE's work in 2018 and the 2022 data from the pumping test on MW3 are the most reliable / representative of the K of the Bobcaygeon Formation in this area of the Carden Plain, as it is based on Site specific testing and in general agreement with previously published on-Site data. Golder's estimate of the K in the Bobcaygeon Formation appears to be several orders of magnitude lower than reported above, which is indicative of the spatial variability of K within this Formation. Based on the above, MTE classifies Zone 1 as a relatively low producing aquifer zone.

7.1.2 Gull River Formation (Zone 2)

The Golder Associates 2012 Report indicated the geometric mean hydraulic conductivity of the Upper Gull River Formation (including the UGMB) was 1.6×10^{-6} m/s.

On-Site testing conducting previously (1995) indicates the hydraulic conductivity within the Lower Bobcaygeon/Upper Gull River (including the UGMB) ranged from 4.0×10^{-6} m/s to 1.0×10^{-8} m/s (Oliver, Mangione, McCalla & Associates Ltd., 1995).

The Table below summarizes the hydraulic conductivity values of the Upper Gull River Formation (including the UGMB) based on on-Site testing and the 2012 Golder Report.

Source	Hydraulic Conductivity
Ferma-Carden Quarry (Oliver, Mangione, McCalla & Associates Ltd., 1995)	4.0×10^{-6} m/s to 1.0×10^{-8} m/s
Quarries analyzed as part of the 2012 Golder Report	1.6×10^{-6} m/s
Ferma-Carden Quarry Pumping Test, MTE Consultants Inc., 2022	6.7×10^{-7} m/s

MTE notes that the 2012 Golder Report identifies and models the Upper Gull River Formation as an aquitard. This interpretation agrees with MTE's testing and is further supported by the lack of water level recovery to static conditions noted in W22a (**Hydrograph 5**).

The 1995 Hydrotechnical Report by Oliver, Mangione, McCalla & Associates Ltd. indicates beneath the Bobcaygeon Formation is an approximatly 10 m thick lower permeable section which MTE is interpretting to be the Upper Gull River Formation. The hydraulic conductivity value calculated based on the data from the pumping test at MW4 on Zone 2 is in agreement with previously presented data, as such Zone 2 (including the UGMB) is considered an aquitard.

7.1.3 Lower Gull River Formation / Shadow Lake Formation / Precambrian Contact Zone (Zone 3)

The Golder Associates 2012 Report indicated the geometric mean hydraulic conductivity of the "Green Bed" within the Gull River Formation, the Lower Gull River Formation (including the LGMB) and the Shadow Lake Formation ranged from 1.1 x 10^{-6} m/s to 2.8 x 10^{-7} m/s. However, MTE notes that the "Green Bed" within the Gull River Formation was reported to have a maximum hydraulic conductivity of 2.8 x 10^{-4} m/s (Golder Associates, 2012). Additionally, a hydraulic conductivity of the Shadow Lake Formation / Precambrian contact is not provided specifically, while a range of 9.2 x 10^{-7} m/s to 9.0 x 10^{-11} m/s is provided. On-Site testing conducted previously (1995) indicates the hydraulic conductivity within the Gull River/Shadow Lake ranged from 7.0 x 10^{-5} m/s to 1.0 x 10^{-8} m/s (Oliver, Mangione, McCalla & Associates Ltd., 1995).

The table below summarizes the hydraulic conductivity values of the area pertaining to Lower Gull River Formation (including the LGMB) down to the Precambrian based on on-Site testing and the 2012 Golder Report.

Source	Hydraulic Conductivity
Ferma-Carden Quarry (Oliver, Mangione, McCalla & Associates Ltd., 1995)	7.0 x 10^{-5} m/s to 1.0 x 10^{-8} m/s
Quarries analyzed as part of the 2012 Golder Report	1.1 x 10^{-6} m/s to 2.8 x 10^{-7} m/s
Ferma-Carden Quarry Pumping Test, MTE Consultants Inc., 2022	4.8 x 10^{-5} m/s

MTE notes that the 2012 Golder Report identifies and models both the "Green Bed" (within the Gull River Formation) and the Shadow Lake Formation /Precambrian contact as an aquifer. Additionally, the 1995 Hydrotechnical Report by Oliver, Mangione, McCalla & Associates Ltd. also identifies the Lower Gull River Formation to the Precambrian basement as an aquifer. As such, the hydraulic conductivity value calculated by MTE based on the data from the 2022 pumping test at MW4 on Zone 3 is in agreement with previously presented data and therefore Zone 3 is considered a relatively highly producing aquifer.

7.2 Water Source Potential Assessment

7.2.1 Water Quantity

The Bobcaygeon Formation (Zone 1) is the primary aquifer in the vicinity of the Site in which domestic wells obtain their water and the Ferma-Carden Quarry extracts high grade carbonate aggregate materials. Previous reports completed on-Site have indicated that as the quarry expands and the extraction area approaches its limits that nearby domestic wells may be impacted. As such, in addition to assessing the hydraulic properties of the underlying bedrock zones MTE also assessed the potential water supply capabilities of the various bedrock zones beneath the Site.

As discussed above, hydraulic testing indicates that the hydraulic conductivity of Zone 2 (which contains the Upper Green Marker Bed) was 6.7 x 10^{-7} m/s, additionally Zone 2 was found to have limited sustainable yield (8 L/min). As such, Zone 2 is not viewed as a viable alternative water source, should nearby residential domestic wells be impacted by quarry extraction.

Anecdotal evidence from the water well record prepared at the time of construction of MW4 (**Appendix E**) indicated that a high producing fracture was encountered in the Lower Gull River Formation. Results from the Zone 3 pumping test that took place in 2022 and the well yield test

on TW4-24 which took place in 2024 confirmed the viability of this zone as a potential future water source. As a result, this aquifer zone (Zone 3) can be considered as a viable alternative aquifer in which to supply water to domestic wells that may experience well interference issues related to the dewatering of the Ferma-Carden Quarry.

7.2.2 Water Quality

As shown on **Figure 9** groundwater samples from each of the three respective bedrock zones plot in a very similar location on the trilinear plot. These results are interpreted to indicate a downward movement of groundwater from Zone 1 to Zone 2 and finally Zone 3 whereby water quality is similar. As such, in the event a nearby resident's domestic well requires replacement due to quarry dewatering, the water quality of a well installed within Zone 3 will have comparable water quality to domestic wells currently completed in Zone 1.

8.0 ROLE OF THE GREEN MARKER BEDS

8.1 Upper Green Marker Bed

Pumping test data from Zone 2 (which contains the UGMB) indicated that this zone had limited water supply potential (8 L/min). These results were found to agree with previous conclusions from 2012 Golder Report categorizing the Upper Gull River Formation as an aquitard. As such, it is MTE's opinion that the UGMB is not considered to be a highly transmissive zone on-Site and would provide low quantities of water, should it be extracted.

Although the water quality within Zone 2 was found to be comparable to Zone 1 (Bobcageon Formation) the limited transmissivity within this zone does not make it a good candidate as an alternative water source.

8.2 Lower Green Marker Bed

Based on hydraulic testing undertaken in 2022 and well yield testing in 2024, Zone 3 is considered to be an alternative water supply with comparable water quality to the Bobcageon Formation. With the LGMB contained within this aquifer zone, this zone would provide significant quantities of water, should quarrying activities be expanded into it.

Maximum Depth of Extraction

As indicated in **Section 1.2** the current maximum extraction depth of Phase 1 is 255 masl. This limit was established in an effort to mitigate potential negative impacts to nearby domestic wells as a result of quarry dewatering. However based on on-Site testing in the event nearby water supply wells are impacted as a result of dewatering, a new supply well could be drilled into Zone 3 to supply the affected resident. As such, in order to protect the potential future water source of Zone 3, MTE recommends the future quarry floor maintain a separation of 10 m above the Lower Green Marker Bed, as shown on **Figure 5 & 6**. Domestic wells completed within Zone 3 or below are not anticipated to be negatively impacted as the depth of the quarry will remain 10 m above the LGMB.

Based on MTE's interpretation of the data presented herein, which combined on-Site current and historical testing as well as a review of hydraulic data from 12 different quarries within the Carden Plain, it is MTE's opinion that extraction should be allowed to occur down to a depth of 10 m above the LGMB while still maintaining the integrity of the underlying water source (Zone 3).

9.0 CONCLUSIONS

Based on the work conducted for the Scope of Work as outlined in Section 1.0, MTE offers the following conclusions:

- The hydraulic conductivity (K) of Zone 1 as measured in MW3 was 2.2 x 10^{-6} m/s, with a transmissivity (T) of 3.9 x 10^{-5} m^2 /day and a storativity of 6.0 x 10^{-2}.Zone 1 is interpreted to be a low producing aquifer.
- The hydraulic conductivity (K) and Transmissivity (T) and Storativity (S) of Zone 2 (including the UGMB) at the MW4 location was determined to be 6.7 x 10^{-7} m/s, 6.5 x 10^{-5} m^2 /day and 6.8 x 10^{-3} respectively. Zone 2 is interpreted to be an aquitard zone.
- The hydraulic conductivity (K), Transmissivity (T) and Storativity (S) of Zone 3, including the Lower Gull River Formation (including the UGMB) / Shadow Lake Formation / Precambrian Contact zone at the MW4 location was determined to be 4.8 x 10^{-5} m/s, 3.1 x 10^{-4} m^2 /day and 7.7 x 10^{-6}, respectively. Zone 3 is interpreted to be a relatively high producing aquifer.
- The hydraulic characteristics of the three bedrock zones are in agreement with previous hydraulic testing that was undertaken on-Site.
- Most nearby domestic wells are completed in the Bobcaygeon (Zone 1).
- Those domestic wells completed within the Lower Gull River Formation, Shadow Lake Formation or underlying Precambrian are not anticipated to be negatively impacted as the depth of the quarry will be 10 m above the LGMB.
- Based on hydraulic testing Zone 3 was found to be a water bearing aquifer zone that can produce sufficient quantities of good quality water for household domestic requirements.
- Zone 3 was found to have comparable water quality to that of Zone 1.
- Zone 3 can be used as a future water source to mitigate the impacts of quarry dewatering.
- To maintain the integrity of Zone 3, MTE's opinion is that the quarry floor can be lowered down to a maximum depth of 10 m above the LGMB.

10.0 RECOMMENDATIONS

Based on the results of the hydraulic and water quality testing described herein, MTE offers the following recommendations:

- Ferma Aggregates Inc. apply for a Site Plan Amendment to increase the depth of extraction to 10 m above the LGMB;
- Prior to expansion into additional phases, Ferma Aggregates conducts sufficient geological and hydraulic testing and analysis to confirm the depth elevation of the LGMB at each phase; and
- On-going monitoring continue as per PTTW 238-BBLKNE.

11.0 LIMITATIONS

Services provided by **MTE Consultants Inc**. (MTE) were conducted in a manner consistent with the level of care and skill ordinarily exercised by members of the Geological Consulting profession. No other warranty or representation, expressed or implied, as to the accuracy of the information, conclusions or recommendations is included or intended in this report.

This report was completed for the sole use of MTE and their client. It was completed in accordance with the scope of work identified in the introduction of the text. As such, this report may not deal with all issues potentially applicable to the Site and may omit issues, which are, or may be, of interest to the reader. All findings and conclusions presented in this report are based on Site conditions, as they existed during the time period of the investigation.

Any use which a third party makes of this report, or any reliance on, or decisions to be made based upon it, are the responsibility of such third parties. MTE accepts no responsibility for liabilities incurred by or damages, if any, suffered by any third party as a result of decisions made or actions taken, based upon this report. Others with interest in the Site should undertake their own investigations and studies to determine how or if the condition affects them or their plans.

Should additional or new information become available, MTE recommends that it be brought to our attention in order that we may re-assess the contents of this report.

We trust this meets your current requirements. If you have any questions or comments, please do not hesitate to contact the undersigned directly at (519) 743-6500.

All of which is respectfully submitted,

MTE Consultants Inc.

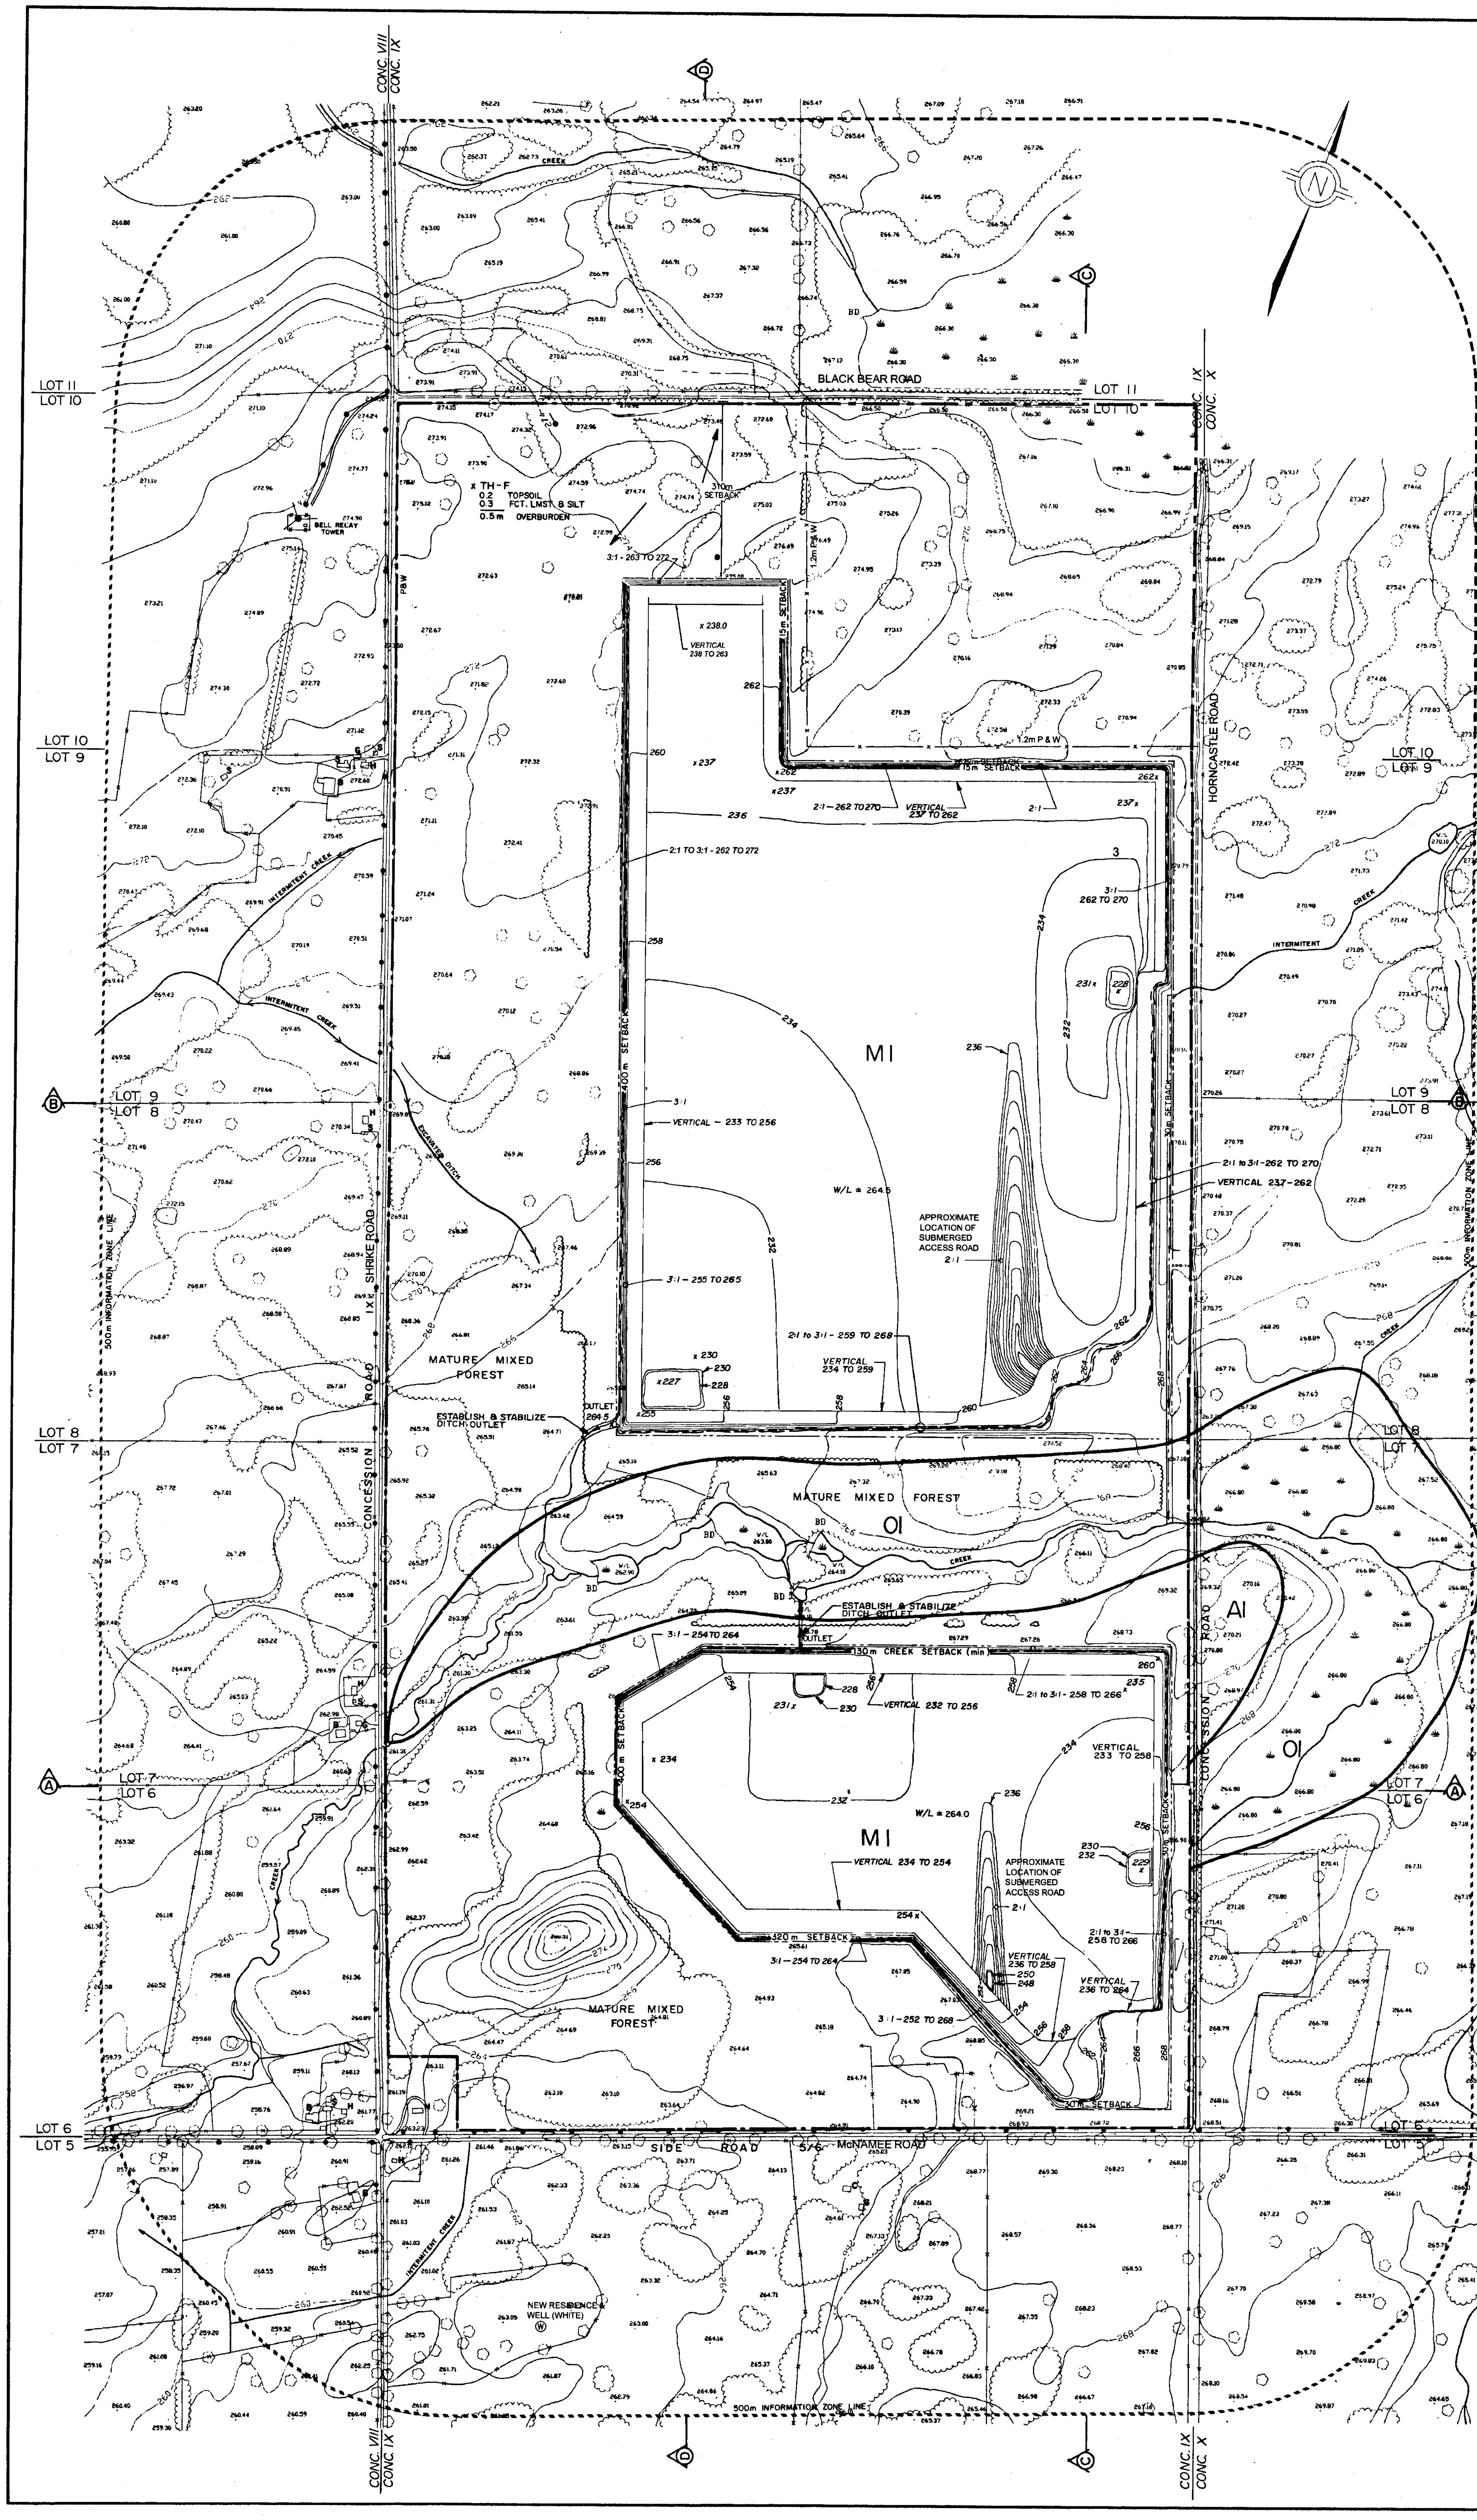
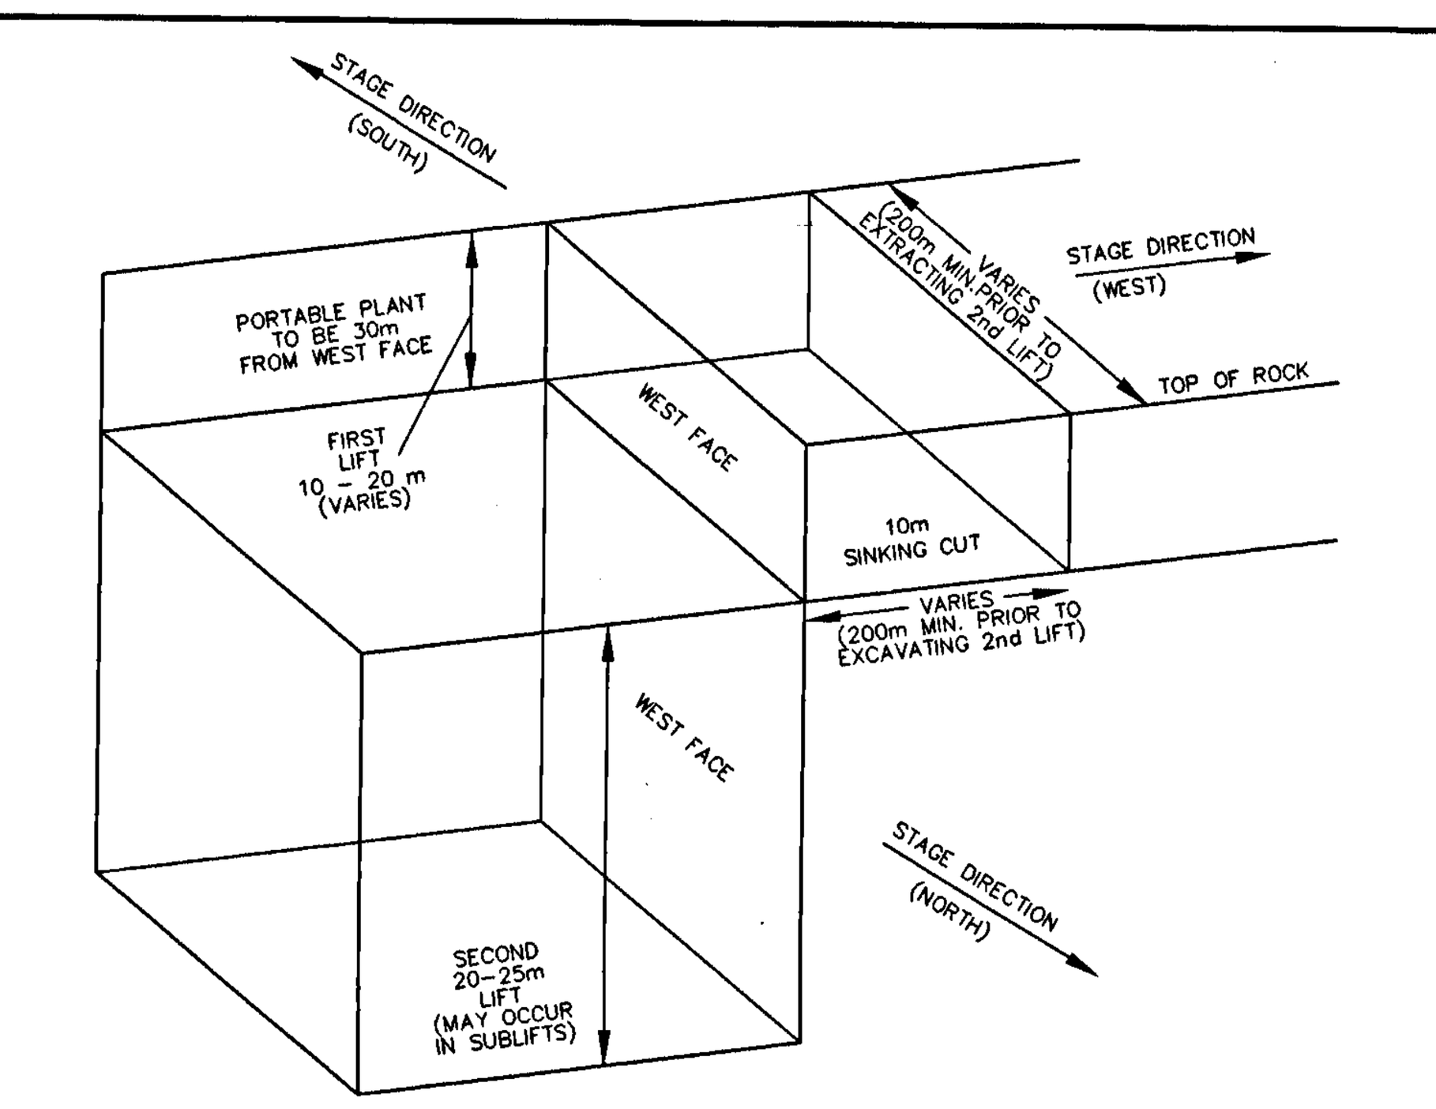
SITE PLAN CONDITIONS

**LOGGERHEAD S





TYPICAL EXTRACTION PATTERN RELATIVE TO WEST DIRECTION

REFERENCE MATERIAL

OLIVER, MANGIONE, MCCALLA & ASSOCIATES LIMITED, "HYDROTECHNICAL REPORT", APRIL 1995.

FINAL REHABILITATION

1) FINAL SLOPES ARE TO BE ESTABLISHED BY RELOCATING PERIMETER BERM MATERIAL OR UNMARKETABLE MATERIAL AND SLOPING AT 3:1 (2:1 MINIMUM) FROM ORIGINAL GROUND TO THE PERIMETER BENCH AND STABILIZING. TOPSOIL RESERVES STOCKPILED ON BERM SCREENS MUST BE STRIPPED, TEMPORARILY STOCKPILED, THEN REAPPLIED TO FINAL SLOPES AND PREPARED FOR HYDROSEEDING WITH A MIXTURE OF CROWMVETCH. UNDESIRABLE AGGREGATE MATERIAL IS TO BE UTILIZED TO PROGRESSIVELY ESTABLISH FINAL PERIMETER SLOPES.

2) REMOVE ALL PLANT, MACHINERY, STUMP STOCKPILE, EQUIPMENT, SCRAP, FUEL STORAGE FACILITIES, AND UNDERTAKE A GENERAL SITE CLEAN-UP OF ANY SOURCE OF POTENTIAL CONTAMINATION. REMOVE PUMP SYSTEMS AND ALLOW TO FLOOD AFTER PERIMETER SLOPES HAVE STABILIZED.

3) FINAL NORTH PART LAKE ELEVATION = ±264.5 WITH OUTLET AT SOUTHWEST CORNER OF LAKE. FINAL SOUTH PART LAKE ELEVATION = ±264.0 WITH OUTLET AT NORTH SIDE NEAR WEST END OF LAKE. ESTIMATED FINAL WATER LEVELS ARE BASED ON TOPOGRAPHIC INTERPOLATION OF CONTROLLING ELEVATIONS.

4) INTERCEPTOR DITCH ON EAST LIMIT OF NORTH PART TO REMAIN TO AVOID THE POSSIBILITY OF LAKE CONTAMINATION BY SURFACE RUNOFF FROM UPSTREAM AGRICULTURAL LANDS.

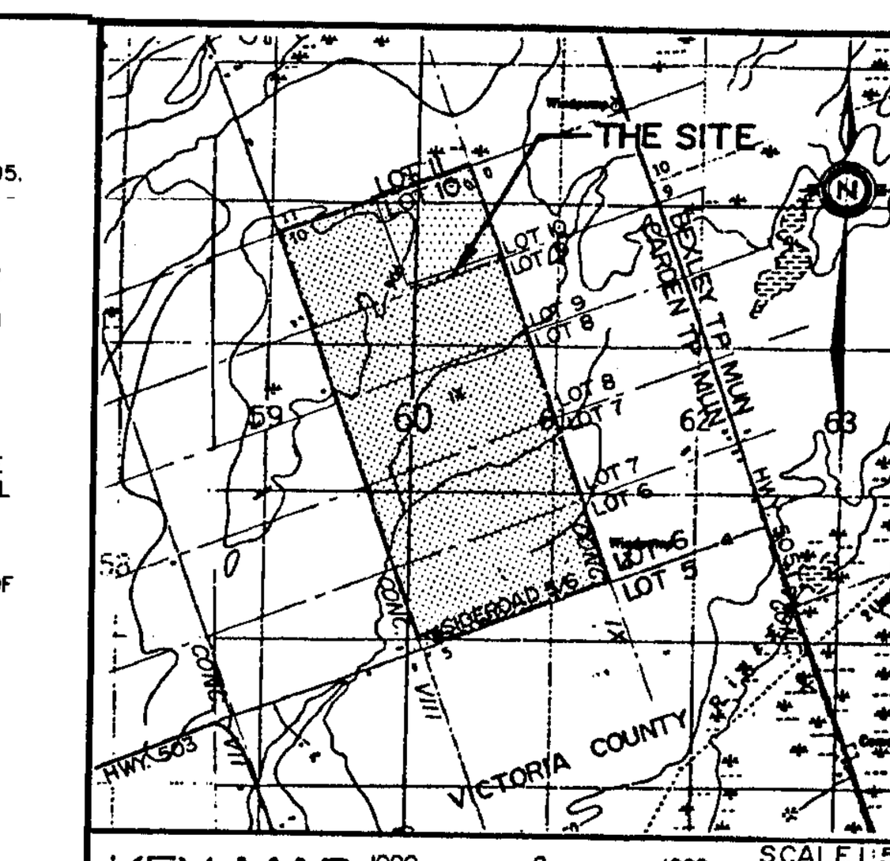
5) UPON SITE FINAL REHABILITATION, THE APPLICABLE PROPOSED LAND USE DESIGNATION UNDER THE PRESENT OFFICIAL PLAN WOULD BE SHORELINE. APPLICABLE ZONING CATEGORIES WOULD INCLUDE: C3 – COMMERCIAL RECREATION, OR C4 – COMMERCIAL CAMPGROUND, OR RR2 – RURAL RESIDENTIAL TYPE TWO.

MINISTRY OF NATURAL RESOURCES

PLANS APPROVED
UNDER THE AGGREGATE RESOURCES ACT

AGGREGATE RESOURCES OFFICER

DATE April/28/03

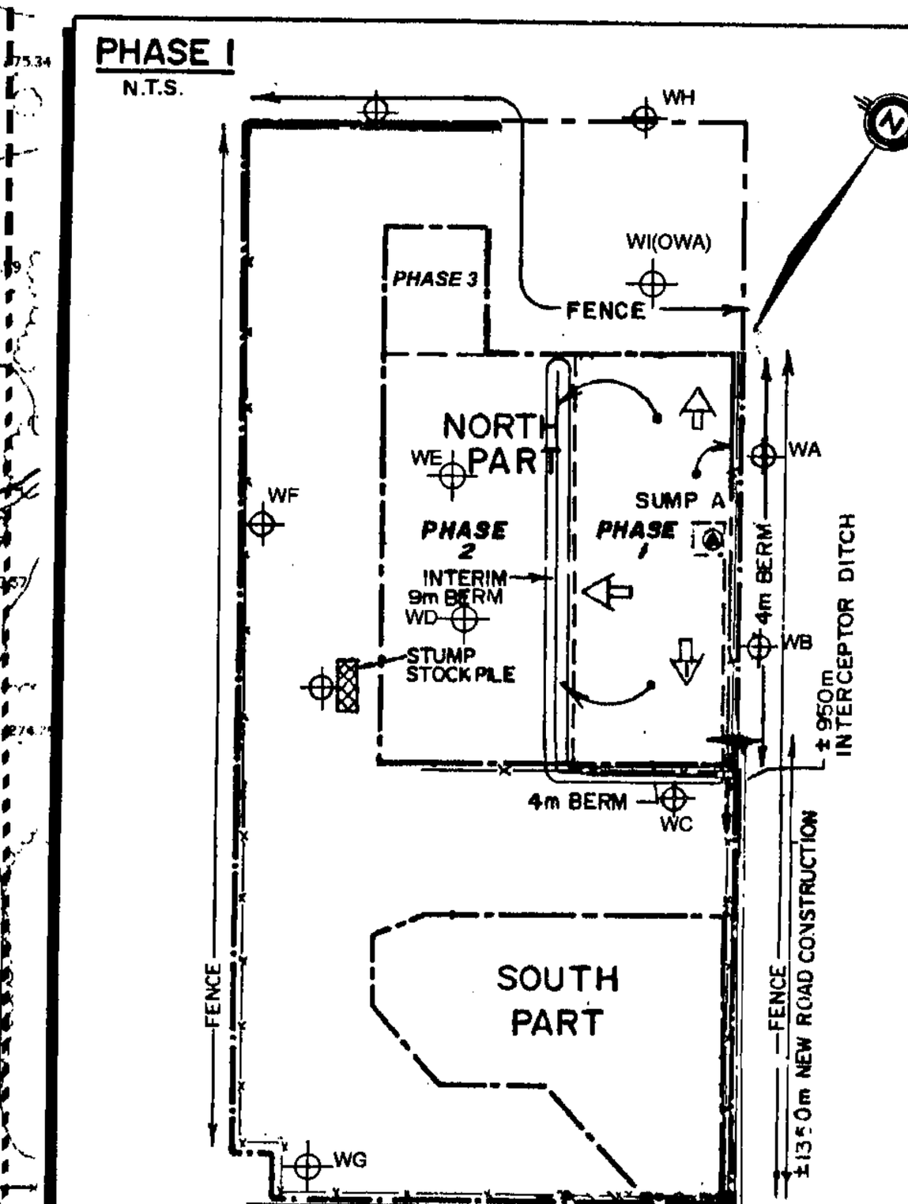


KEY MAP 1000 0 1000 2000 SCALE 1:50000

NOTES

1. LICENSED AREA – 427.2 ha
2. AREA OF EXTRACTION — SOUTH PART – 58.3 ha; NORTH PART – 127.9 ha; TOTAL 186.2 ha
3. AREA TO BE REHABILITATED — S. PART – 71.5 ha; N. PART – 163.0 ha; TOTAL 234.5 ha
4. THE WATER TABLE ELEVATION RANGES BETWEEN 258.0 AND 273.0, AND BETWEEN 0.0 m AND 14 m BELOW THE GROUND SURFACE AS RECORDED BY FIELD SURVEY.
5. THIS PLAN WAS PREPARED USING PHOTOGRAMMETRIC METHODS FROM AERIAL PHOTOGRAPHS.
6. LOT, CONCESSION AND BOUNDARY LINES ON THIS PLAN ARE APPROXIMATE.
7. THIS IS NOT A LEGAL SURVEY DRAWING IN ACCORDANCE WITH THE PROVINCE OF ONTARIO SURVEYORS ACT 1987.

PHASE 1
N.T.S.

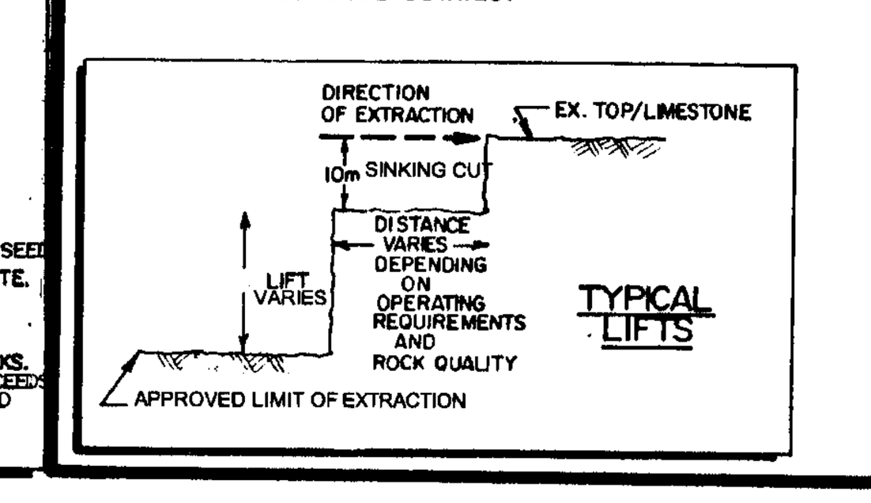


- IMPROVE SIDEROAD 5/6 TO HWYS 502 & 505
- INSTALL ADDITIONAL MONITORING WELLS AS REQUIRED
- CONSTRUCT INTERCEPTOR DITCH
- STRIP PHASE 1 & CONSTRUCT INTERIM & PERIMETER BERM & STABILIZE WITH SEED
- REINSTATE/ERECT PERIMETER 1.2 m POST & WIRE FENCING & ERECT ENTRANCE GATE.
- CONSTRUCT ±1350m OF MUNICIPAL ROAD & IMPROVEMENTS TO SIDEROAD 5/6
- ESTABLISH SCALE HOUSE & OFFICE.
- EXTRACT PH. 1 – STAGE 1 & CONSTRUCT SUMP A, AND INSTALL DEWATERING WORKS.
- ESTABLISH FINAL SLOPES ON PERIMETER BENCH AS EXTRACTION PROCEEDS USING UNMARKETABLE AGGREGATE, STABILIZE WITH TOPSOIL & HYDROSEED
- EXTRACT STAGES 2 THEN 3
- STAGES TO OCCUR IN SEQUENTIAL LIFTS

LEGEND

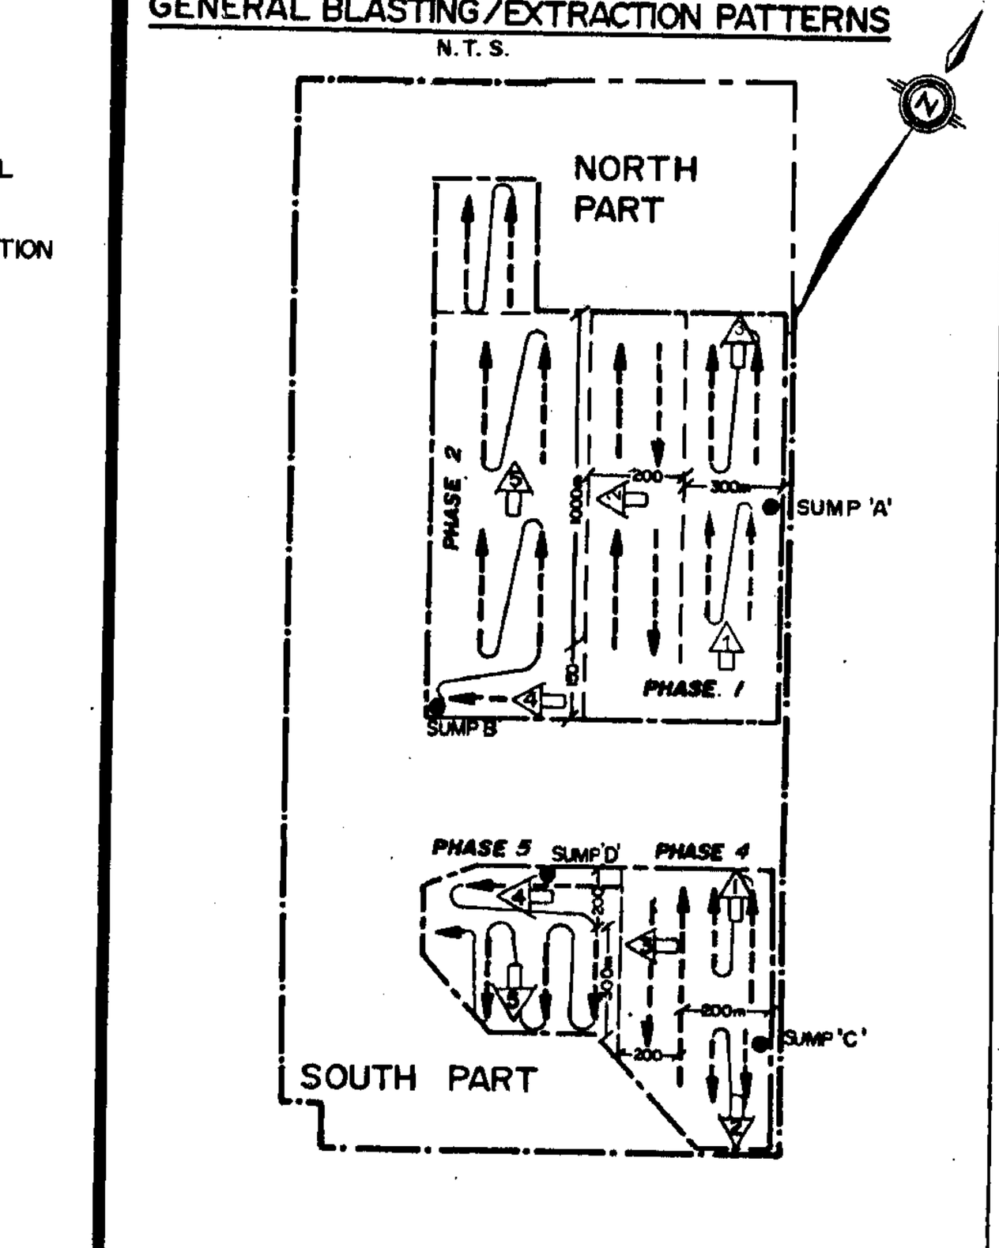
- PROPOSED MONITORING WELL
- STAGE & DIRECTION OF EXTRACTION
- PHASE LIMIT
- TREES
- FENCE
- BERMS
- DITCH / DRAINAGE OUTLET
- PUMP(S)
- SLOPE
- ENTRANCE / EXIT
- OVERBURDEN RELOCATION

NOTE: REFER TO OPERATIONAL PLAN FOR PHASE SEQUENCE DETAILS.



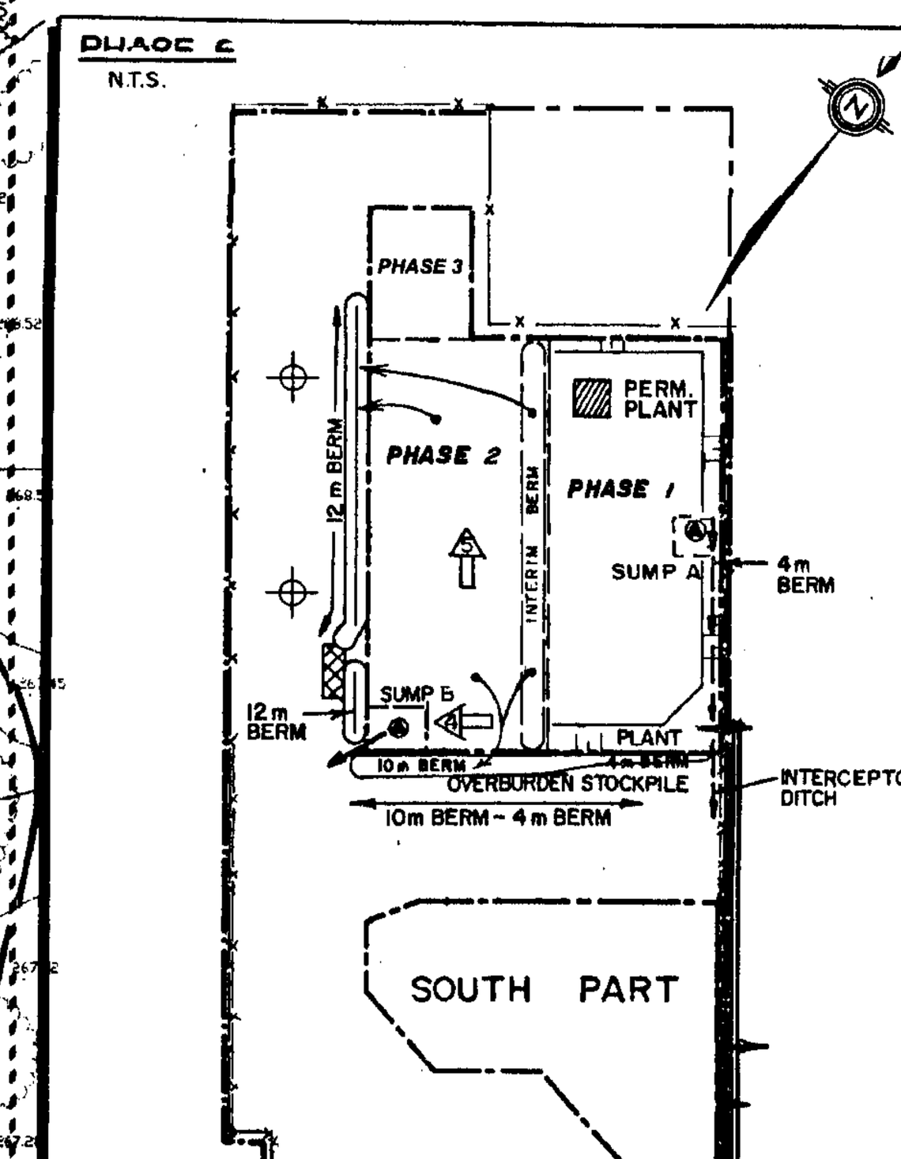
TYPICAL LIFTS

GENERAL BLASTING/EXTRACTION PATTERNS
N.T.S.



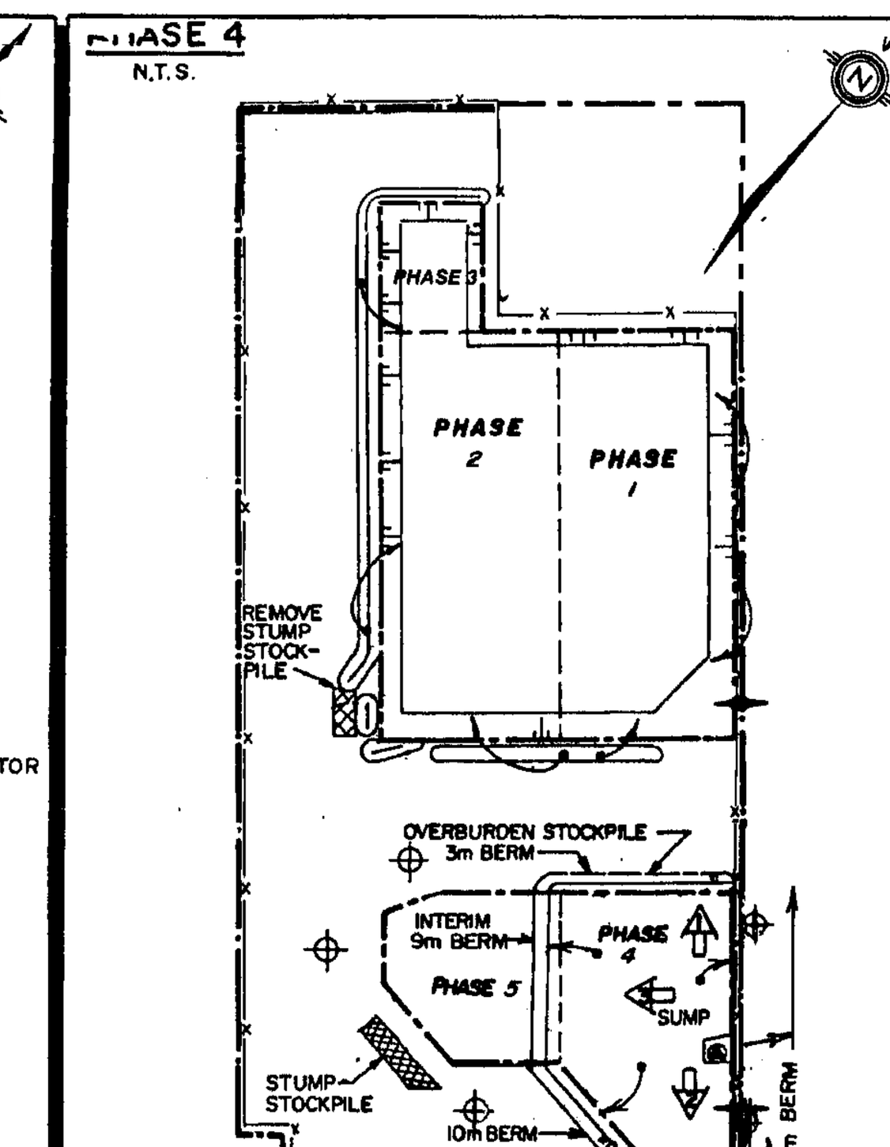
- PROPOSED BLASTING/EXTRACTION PATTERNS ARE BASED ON DRAINAGE & NOISE ATTENUATION REQUIREMENTS.
- PORTABLE PLANT TO BE WITHIN 30-50m OF WEST FACE
- GENERAL PATTERN IS NORTH / SOUTH WITH OVERALL PROGRESSION TOWARDS THE WEST.

PHASE 2
N.T.S.



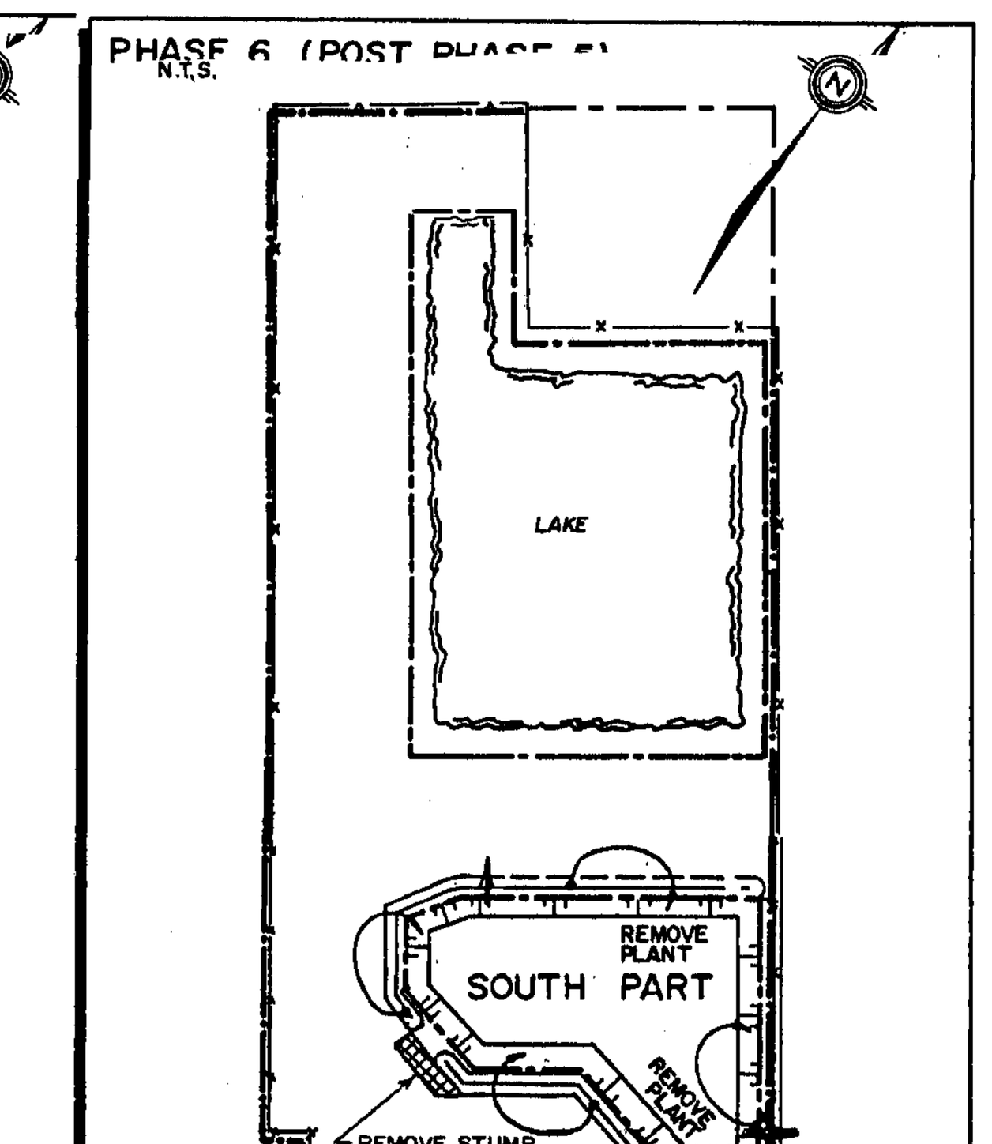
- ERECT PERMANENT IN PHASE 1 PLANT SHOULD PRODUCTION WARRENT
- PROGRESSIVELY STRIP PHASE 2, REMOVE INTERIM BERM & CONSTRUCT PERIMETER BERMS
- PLANT PERIMETER BERMS
- EXTRACT PHASE 2 - STAGE 4 & CONSTRUCT SUMP B & OUTLET DITCH, INSTALL DEWATERING WORKS
- EXTRACT PHASE 2 - STAGE 5. • STAGES TO OCCUR IN SEQUENTIAL LIFTS
- INSTALL ADDITIONAL MONITORING WELLS AS REQUIRED
- ESTABLISH FINAL SLOPES ON PERIMETER BENCH AS EXTRACTION PROCEEDS USING UNMARKETABLE AGGREGATE, STABILIZE WITH TOPSOIL & HYDROSEED

PHASE 4
N.T.S.



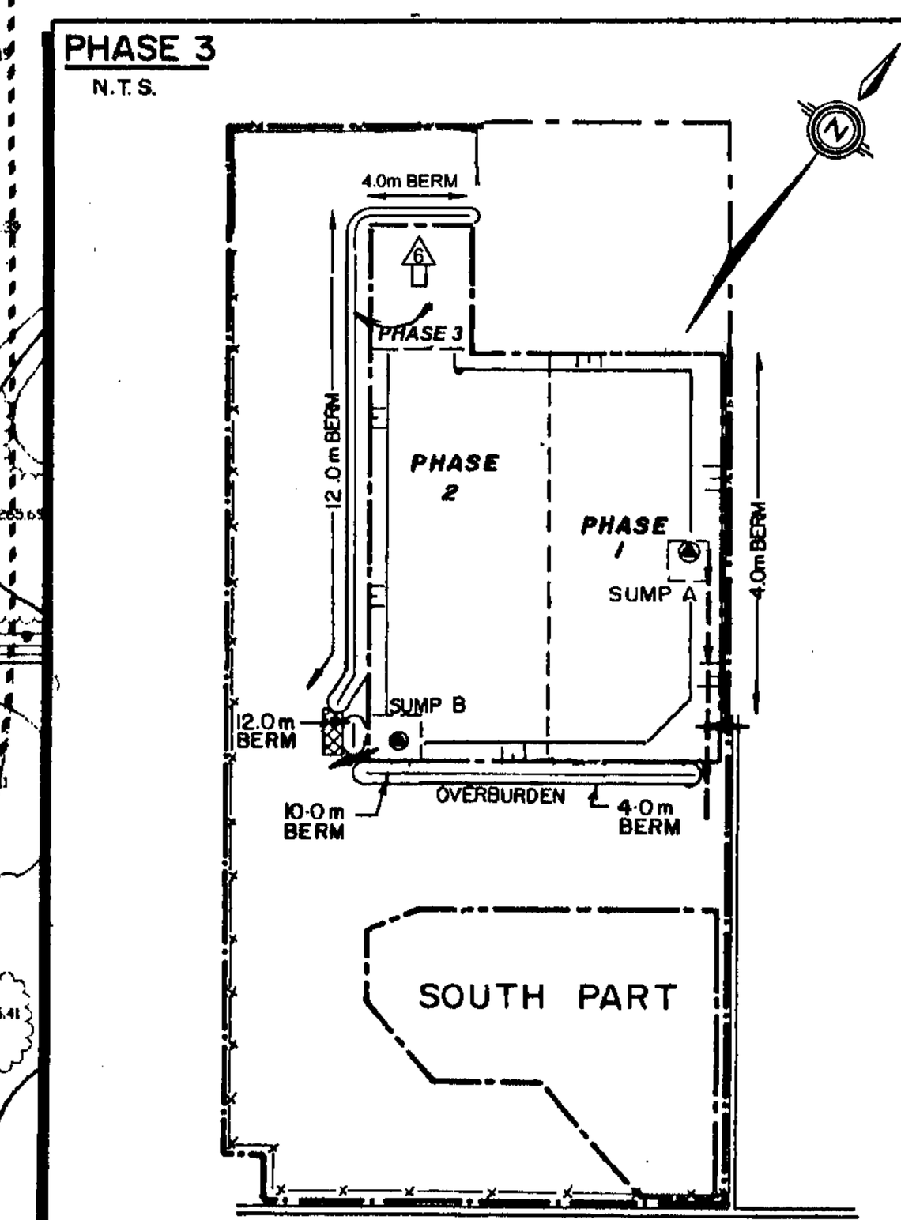
- INSTALL ADDITIONAL MONITORING WELLS AS REQUIRED
- MOVE SCALE HOUSE, OFFICE TO S. PART & REMOVE PERMANENT PLANT
- PROGRESSIVELY STRIP PHASE 4, CONSTRUCT INTERIM & PERIMETER BERM, PLANT TREES & STABILIZE WITH TOPSOIL & SEED
- EXTRACT PHASE 4 - STAGE 1, CONSTRUCT SUMP C & INSTALL DEWATERING WORKS.
- CONCURRENTLY COMPLETE FINAL SLOPES AROUND PERIMETER OF N. PART
- EXTRACT PHASE 4 - STAGE 2. • STAGES TO OCCUR IN SEQUENTIAL LIFTS

PHASE 6 (POST PHASE 5)
N.T.S.



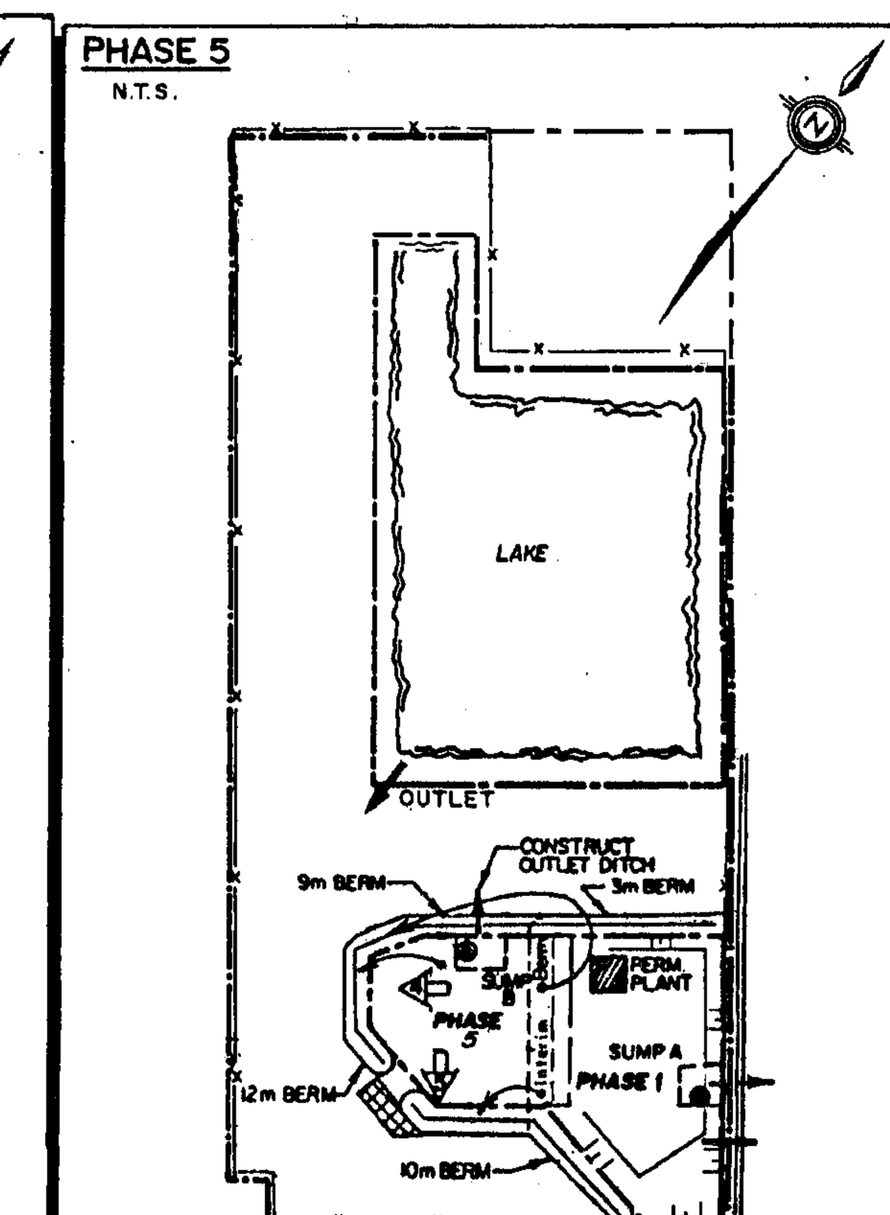
- COMPLETE EXTRACTION OF SOUTH PART - STAGE 5
- REMOVE SCALEHOUSE, OFFICE, PLANT & STUMP STOCKPILE
- COMPLETE FINAL SLOPES AROUND PERIMETER OF SOUTHERN PART

PHASE 3
N.T.S.



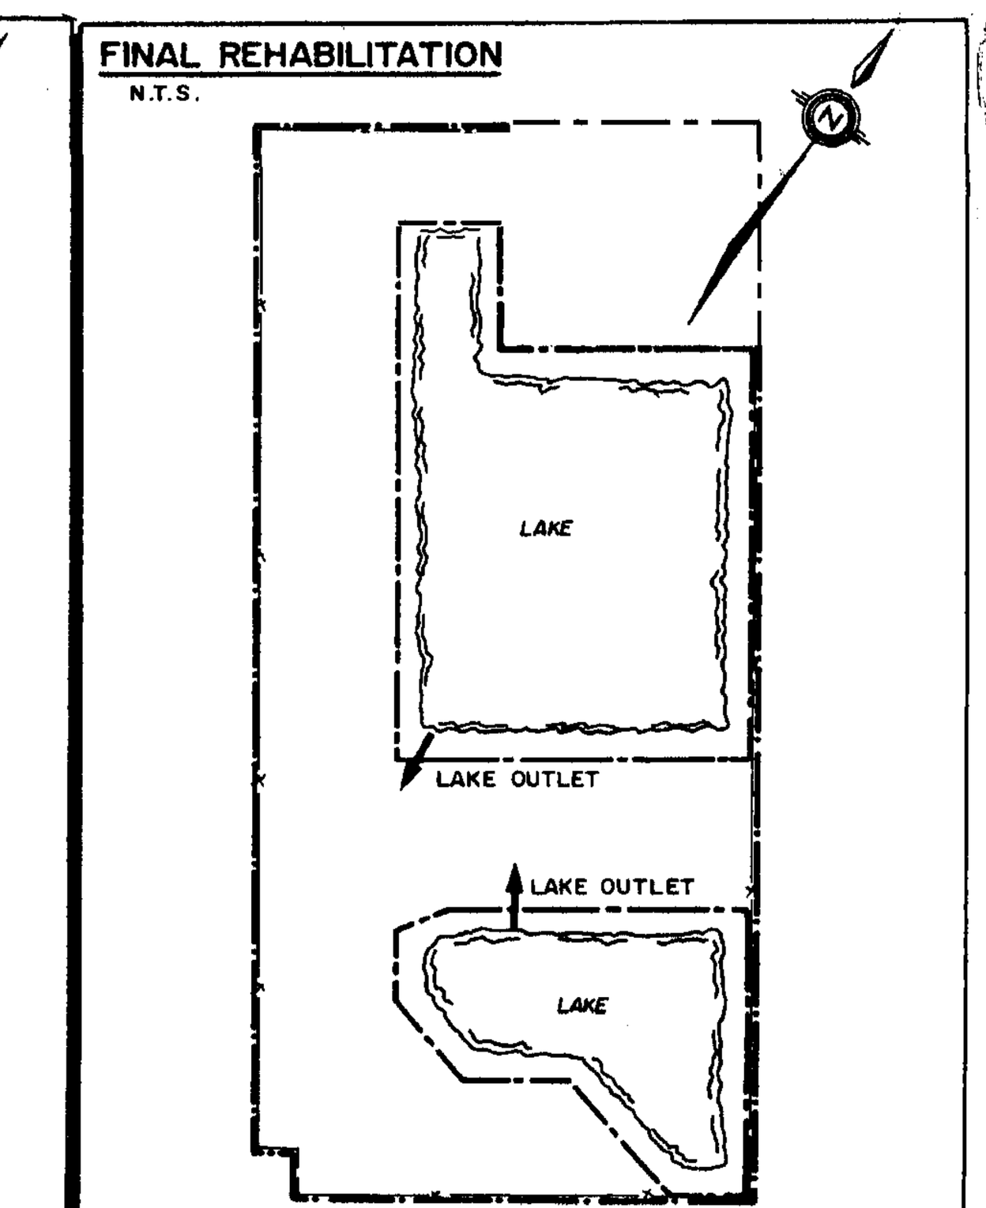
- STRIP PHASE 3 & CONSTRUCT REMAINING PERIMETER BERM SCREEN & STABILIZE
- PLANT TREES ON PERIMETER BERM
- EXTRACT PHASE 3-STAGE 6. STAGES TO OCCUR IN SEQUENTIAL LIFTS
- ESTABLISH FINAL SLOPES ON PERIMETER BENCH AS EXTRACTION PROCEEDS USING UNMARKETABLE AGGREGATE, STABILIZE WITH TOPSOIL & HYDROSEED

PHASE 5
N.T.S.



- ERECT PERMANENT PLANT SHOULD PRODUCTION WARRENT
- REMOVE INTERIM BERM & STRIP PHASE 5
- CONSTRUCT REMAINING PERIMETER BERMS & PLANT
- EXTRACT PHASE 5 - STAGE 4 & CONSTRUCT SUMP D & OUTLET DITCH, INSTALL DEWATERING WORKS
- EXTRACT PHASE 5 - STAGE 5.
- STAGES TO OCCUR IN SEQUENTIAL LIFTS
- ESTABLISH FINAL SLOPES ON PERIMETER BENCH AS EXTRACTION PROCEEDS USING UNMARKETABLE AGGREGATE, STABILIZE WITH TOPSOIL & HYDROSEED
- INSTALL ADDITIONAL MONITORING WELLS AS REQUIRED

FINAL REHABILITATION
N.T.S.



- PROPOSED POST REHABILITATION DEVELOPMENT PLAN TO BE APPROVED BY MUNICIPALITY PRIOR TO REZONING FROM INDUSTRIAL EXTRACTIVE TO COMMERCIAL / RECREATIONAL OR RURAL RESIDENTIAL.
- ALL WELLS NO LONGER USE ARE TO BE REMOVED

Toronto, Ontario
M4V 1L

Report Number: 04-1120-800-3

Distribution:

1 copy - Ontario Ministry of the Environment
1 copy - R.W. Tomlinson Limited
2 copies - Golder Associates Ltd.

Golder Associates

LIST OF ABBREVIATIONS

The abbreviations commonly employed on Records of Boreholes, on figures and in the text of the report are as follows:

I. SAMPLE TYPE

AS	Auger sample
BS	Block sample
CS	Chunk sample
DO	Drive open
DS	Denison type sample
FS	Foil sample
RC	Rock core
SC	Soil core
ST	Slotted tube
TO	Thin-walled, open
TP	Thin-walled, piston
WS	Wash sample

II. PENETRATION RESISTANCE

Standard Penetration Resistance (SPT), N:
The number of blows by a 63.5 kg. (140 lb.) hammer dropped 760 mm (30 in.) required to drive a 50 mm (2 in.) drive open Sampler for a distance of 300 mm (12 in.)

Dynamic Penetration Resistance; N_d:
The number of blows by a 63.5 kg (140 lb.) hammer dropped 760 mm (30 in.) to drive Uncased a 50 mm (2 in.) diameter, 60^0 cone attached to "A" size drill rods for a distance of 300 mm (12 in.).

PH:	Sampler advanced by hydraulic pressure
PM:	Sampler advanced by manual pressure
WH:	Sampler advanced by static weight of hammer
WR:	Sampler advanced by weight of sampler and rod

Peizo-Cone Penetration Test (CPT):
An electronic cone penetrometer with a 60^0 conical tip and a projected end area of 10 cm^2 pushed through ground at a penetration rate of 2 cm/s. Measurements of tip resistance (Q_t), porewater pressure (PWP) and friction along a sleeve are recorded Electronically at 25 mm penetration intervals.

III. SOIL DESCRIPTION

(a) Cohesionless Soils

Density Index (Relative Density)	N Blows/300 mm Or Blows/ft.
Very loose	0 to 4
Loose	4 to 10
Compact	10 to 30
Dense	30 to 50
Very dense	over 50

(b) Cohesive Soils

Consistency	$C_{u2}S_u$ Kpa	Psf
Very soft	0 to 12	0 to 250
Soft	12 to 25	250 to 500
Firm	25 to 50	500 to 1,000
Stiff	50 to 100	1,000 to 2,000
Very stiff	100 to 200	2,000 to 4,000
Hard	Over 200	Over 4,000

IV. SOIL TESTS

w	water content
w_p	plastic limited
w_l	liquid limit
C	consolidaiton (oedometer) test
CHEM	chemical analysis (refer to text)
CID	consolidated isotropically drained triaxial test[1]
CIU	consolidated isotropically undrained triaxial test with porewater pressure measurement[1]
D_R	relative density (specific gravity, G_s)
DS	direct shear test
M	sieve analysis for particle size
MH	combined sieve and hydrometer (H) analysis
MPC	modified Proctor compaction test
SPC	standard Proctor compaction test
OC	organic content test
SO_4	concentration of water-soluble sulphates
UC	unconfined compression test
UU	unconsolidated undrained triaxial test
V	field vane test (LV-laboratory vane test)
γ	unit weight

Note:
1. Tests which are anisotropically consolidated prior shear are shown as CAD, CAU.

LIST OF SYMBOLS

Unless otherwise stated, the symbols employed in the report are as follows:

I. GENERAL

π	= 3.1416
ln x, natural logarithm of x	
$\log_{10}$ x or log x, logarithm of x to base 10	
g	Acceleration due to gravity
t	time
F	factor of safety
V	volume
W	weight

II. STRESS AND STRAIN

γ	shear strain
Δ	change in, e.g. in stress: $\Delta\sigma'$
ε	linear strain
ε_v	volumetric strain
η	coefficient of viscosity
ν	Poisson's ratio
σ	total stress
σ'	effective stress ($\sigma' = \sigma$"-u)
σ'_{vo}	initial effective overburden stress
$\sigma_1\sigma_2\sigma_3$	principal stresses (major, intermediate, minor)
σ_{oct}	mean stress or octahedral stress $= (\sigma_1+\sigma_2+\sigma_3)/3$
τ	shear stress
u	porewater pressure
E	modulus of deformation
G	shear modulus of deformation
K	bulk modulus of compressibility

III. SOIL PROPERTIES

(a) Index Properties

$\rho(\gamma)$	bulk density (bulk unit weight*)
$\rho_d(\gamma_d)$	dry density (dry unit weight)
$\rho_w(\gamma_w)$	density (unit weight) of water
$\rho_s(\gamma_s)$	density (unit weight) of solid particles
γ'	unit weight of submerged soil ($\gamma'=\gamma-\gamma_w$)
D_R	relative density (specific gravity) of solid particles ($D_R = \rho_s/\rho_w$) formerly (G_s)
e	void ratio
n	porosity
S	degree of saturation

* Density symbol is ρ. Unit weight symbol is γ where $\gamma=\rho g$(i.e. mass density x acceleration due to gravity)

(a) Index Properties (cont'd.)

w	water content
w_l	liquid limit
w_p	plastic limit
I_p	plasticity Index=(w_l-w_p)
w_s	shrinkage limit
I_L	liquidity index=$(w-w_p)/I_p$
I_c	consistency index=$(w_l-w)/I_p$
e_{max}	void ratio in loosest state
e_{min}	void ratio in densest state
I_D	density index-$(e_{max}-e)/(e_{max}-e_{min})$ (formerly relative density)

(b) Hydraulic Properties

h	hydraulic head or potential
q	rate of flow
v	velocity of flow
i	hydraulic gradient
k	hydraulic conductivity (coefficient of permeability)
j	seepage force per unit volume

(c) Consolidation (one-dimensional)

C_c	compression index (normally consolidated range)
C_r	recompression index (overconsolidated range)
C_s	swelling index
C_a	coefficient of secondary consolidation
m_v	coefficient of volume change
c_v	coefficient of consolidation
T_v	time factor (vertical direction)
U	degree of consolidation
σ'_p	pre-consolidation pressure
OCR	Overconsolidation ratio=σ'_p/σ'_{vo}

(d) Shear Strength

$\tau_p\tau_r$	peak and residual shear strength
ϕ'	effective angle of internal friction
δ	angle of interface friction
μ	coefficient of friction=tan δ
c'	effective cohesion
c_u, S_u	undrained shear strength (ϕ=0 analysis)
p	mean total stress $(\sigma_1+\sigma_3)/2$
p'	mean effective stress $(\sigma'_1+\sigma'_3)/2$
q	$(\sigma_1-\sigma_3)/2$ or $(\sigma'_1-\sigma_3)/2$
q_u	compressive strength $(\sigma_1-\sigma_3)$
S_t	sensitivity

Notes: 1. $\tau=c'\sigma'\tan\phi'$

2. Shear strength=(Compressive strength)/2

LITHOLOGICAL AND GEOTECHNICAL ROCK DESCRIPTION TERMINOLOGY

WEATHERING STATE

Fresh: no visible sign of weathering

Faintly Weathered: weathering limited to the surface of major discontinuities.

Slightly weathered: penetrative weathering developed on open discontinuity surfaces but only slight weathering of rock material.

Moderately weathered: weathering extends throughout the rock mass but the rock material is not friable

Highly weathered: weathering extends throughout rock mass and the rock material is partly friable.

Completely weathered: rock is wholly decomposed and in a friable condition but the rock texture and structure are preserved.

BEDDING THICKNESS

Description	Bedding Plane Spacing
Very thickly bedded	>2 m
Thickly bedded	0.6 m to 2m
Medium bedded	0.2 m to 0.6 m
Thinly bedded	60 mm to 0.2 m
Very thinly bedded	20 mm to 60 mm
Laminated	6 mm to 20 mm
Thinly laminated	<6 mm

JOINT OR FOLIATION SPACING

Description	Spacing
Very wide	>3 m
Wide	1 – 3 m
Moderately close	0.3 – 1 m
Close	50 – 300 mm
Very close	<50 mm

GRAIN SIZE

Term	Size*
Very Coarse Grained	>60 mm
Coarse Grained	2 – 60 mm
Medium Grained	60 microns - 2mm
Fine Grained	2 – 60 microns
Very Fine Grained	<2 microns

Note: *Grains >60 microns diameter are visible to the naked eye.

O:\ Templates\Rock Description Terminology

CORE CONDITION

Total Core Recovery

The percentage of solid drill core recovered regardless of quality or length, measured relative to the length of the total core run.

Solid Core Recovery (SCR)

The percentage of solid drill core, regardless of length, recovered at full diameter, measured relative to the length of the total core run.

Rock Quality Designation (RQD)

The percentage of solid drill core, greater than 100 mm length, recovered at full diameter, measured relative to the length of the total core run. RQD varies from 0% for completely broken core 100% for core in solid sticks.

DISCONTINUITY DATA

Fracture Index

A count of the number of discontinuities (physical separations) in the rock core, including both naturally occurring fractures and mechanically induced breaks caused by drilling.

Dip with Respect to (W.R.T.) Core Axis

The angle of the discontinuity relative to the axis (length) of the core. In a vertical borehole a discontinuity with a 90^0 angle is horizontal.

Description and Notes

An abbreviated description of the discontinuities, whether naturally occurring separations such as fractures, bedding planes and foliation planes or mechanically induced features caused by drilling such as ground or shattered core and mechanically separated bedding or foliation surfaces. Additional information concerning the nature information concerning the nature of fracture surfaces and infillings are also noted.

Abbreviations

B –	Bedding	Ca-	Calcite
FO-	Foliation/Schistosity	P-	Polished
CL -	Cleavage	S-	Slickensided
SH -	Shear Plane/Zone	SM-	Smooth
VN-	Vein	R-	Ridged/Rough
F -	Fault	ST-	Stepped
CO-	Contact	PL-	Planar
J -	Joint	FL-	Flexured
FR-	Fracture	UE-	Uneven
MF -	Mechanical	W-	Wavy
A-	Angular	C-	Curved
BP-	Bedding Plane	H-	Hackly
BL-	Blast Induced	SL-	Sludge Coated
ll	Parallel To	TCA-	To Core Axis
	Perpendicular To	STR-	Stress Induced

15		Bobcaygeon Formation 15.0 m to 28.35 m Sharp contact with Verulam Formation. Fresh, medium brownish grey to medium grey, fine grained micritic to medium grained crystalline calcarenitic, thinly to thickly bedded, interbedded argillaceous limestone to calcarenitic limestone with argillaceous shaly bedding partings. From 15.00 m to 16.60 m: Fresh medium brown, medium grained crystalline, faintly petroliferous, medium to thickly bedded calcarenite limestone. From 16.60 m to 18.36 m: Fresh medium brownish grey, fine to medium grained, thinly to medium bedded, nodular, argillaceous, micritic to calcarenitic limestone. From 18.36 m to 19.90 m: Fresh, medium brownish grey, fine grained, thinly bedded, nodular, argillaceous, micritic limestone with numerous dark grey to black argillaceous to shaly bedding partings up to 1 cm thick. From 19.90 m to 24.95 m: Fresh, light to medium brownish grey, fine grained, thinly to medium bedded, nodular, argillaceous, micritic limestone with argillaceous shaly partings interbedded with occasional brownish grey, fine to medium grained, crystalline thin to medium beds of fossiliferous, bioclastic (crinoid, coral) calcarenitic limestone and very thin lithoclastic limestone beds. First fossiliferous calcarenite bed occurs between 24.70 m and 24.95 m. Distinctive coral fossil inclusion at 23.40 m in calcarenite bed between 23.30 m and 23.50 m. From 24.95 m to 28.35 m: Fresh, light grey to creamy light grey, very fine grained, thinly to medium bedded lithographic limestone with disseminated medium grained calcite crystals and occasional minor pyrite grains interbedded with light brownish grey, fine grained, thinly to medium bedded, nodular, argillaceous, micritic limestone. First nodular, micritic limestone bed occurs between 27.85 m and 27.93 m. Light grey, plastic clay parting 2 mm thick at 26.83 m.		15.00	11										Bentonite Seal

45		Gull River Formation 29.26 m to 46.20 m (Continued - See previous page for detailed description)			31												
				201.59													
46		Shadow Lake Formation 46.20 m to 54.90 m From 46.20 m to 49.68 m: Fresh, light to dark greenish grey, fine to medium grained, faintly to moderately porous, thinly to medium bedded, quartz sandstone with siltstone partings. Greenish grey sandy siltstone beds with green shale lithoclasts at 46.20 m to 46.70 mm. Transitional lower contact. From 49.68 m to 52.52 m: Fresh, medium to dark greenish grey, slake susceptible shale and shaly siltstone with dark reddish brown shale between 51.75 m and 51.98 m and interbedded dark reddish brown and green shale to 52.25 m. Transitional lower contact. From 52.25 m to 54.90 m: Fresh, light green to dark reddish brown, fine to coarse grained, faintly porous, thinly to medium bedded sandstone comprised of angular clasts of feldspar crystals and quartz. Sharp basal contact.		46.20	32											A well constructed with 32mm diameter schedule 40 PVC flush threaded pipe and No. 10 slotted screen.

Dark grey, slaking shale from 27.08 m to 27.13 m. Silty to sandy lithoclastic dolostone at 27.13 m to 27.27 m. Distinct, light greenish grey, fine grained siliceous, lithoclastic dolostone bed occurs at 27.27 m to 27.73 m. Weathered shale parting at 29.25 m. Reddish brown, thin shaly dolostone beds at 30.40 m to 30.45 m with disseminated pyrite and 31.75 m to 37.80 m.			19

Unit 2 35.55 m to 38.88 m Fresh, light creamy grey, very fine grained, medium to thickly bedded, lithographic limestone with occasional stylolite (36.75 m), mottled textured beds (35.55 m to 35.60 m, 36.75 m to 37.06 m and 38.10 m to 38.68 m) and argillaceous bedding partings. Unit 1 38.88 m to 45.10 m Fresh, light grey, fine grained, thinly to thickly bedded dolomitic limestone and dolostone with occasional disseminated medium grained calcite crystals argillaceous bedding partings, a stylolite (42.64 m), mottled textured bed (40.34 m to 41.50 m) and thin, laminar textured beds. Distinct, light greenish grey, fine grained siliceous, lithoclastic dolostone beds occur at 38.92 m to 40.34 m and 43.54 m to 43.62 m. Reddish brown, thin shaly dolostone beds at 43.62 m to 43.68 m and 44.35 m to 44.37 m. Silty to sandy lithoclastic dolostone at 44.37 m to 44.76 m. Base bed marked by buff brown dolostone from 44.76 m to 45.10 m. Top of Unit 1 marked by open argillaceous bedding partings between 38.88 m and 38.94 m. Distinct white, soft marl layers occur at 39.85 m to 39.92 m and at 41.83 m to 41.86 m overlying weathered black shale from 41.86 m to 41.88 m.				Bentonite Seal

		Verulam Formation 0.06 m to 16.30 m Fresh, faintly to moderately weathered on bedding partings, tan grey to medium grey, very fine to fine grained, thinly bedded, micritic, nodular argillaceous limestone. Sequence contains dark grey to black shaly bedding partings, circular 2 mm to 6 mm burrow casts and occasional thinly to medium bedded, brownish grey, fine to medium crystalline, fossiliferous (crinoids, corals, pelycepods) calcarenite beds and minor, very thin, lithoclastic calcarenite beds associated with rip up clasts. Numerous shaly partings from 3.69 m to 4.86 m and 13.92 m to 15.04 m

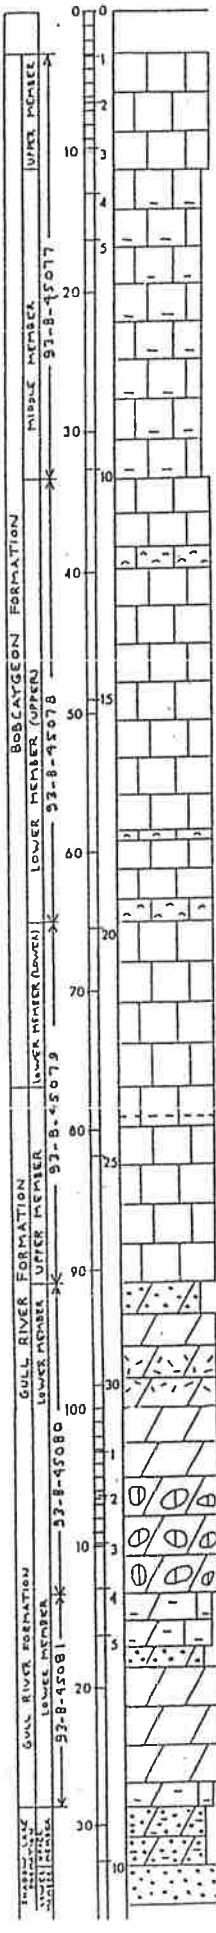
COLUMNAR SECTION

FERMA CONSTRUCTION — BH 93-4, VICTORIA ROAD
LOGGED BY D.A. WILLIAMS — JULY 1993



0.97 m — LIMESTONE, CALCISILTITE TO CALCARENITE, LIGHT OLIVE GREY TO MEDIUM LIGHT GREY TO MEDIUM DARK GREY, THIN TO THICK BEDDED, FOSSILIFEROUS, STYLOLITES, SUBORDINATE UNDULATING DARK GREY SHALY PARTINGS

3.16 m — LIMESTONE, CALCISILTITE TO CALCARENITE, MEDIUM LIGHT GREY TO MEDIUM DARK GREY, THIN TO THICK BEDDED, FOSSILIFEROUS STYLOLITES, INTRACLASTIC IN PLACES, UNDULATING DARK GREY SHALY PARTINGS, NODULAR STRUCTURE IN PLACES

10.20 m — LIMESTONE, CALCISILTITE TO CALCARENITE, MEDIUM LIGHT GREY TO MEDIUM GREY, THIN TO THICK BEDDED, FOSSILIFEROUS STYLOLITES, CALCITE BLEBS, INTRACLASTIC IN PLACES, SUBORDINATE UNDULATING DARK GREY SHALY PARTINGS

11.64 m
12.15 m
17.84 m
18.05 m
19.39 m
19.84 m — LIMESTONE, CALCILUTITE TO CALCISILTITE, PALE YELLOWISH BROWN TO LIGHT GREY TO MEDIUM DARK GREY, THIN TO THICK BEDDED, STYLOLITES, CALCITE BLEBS, INTRACLASTIC IN PLACES, SUBORDINATE UNDULATING DARK GREY SHALY PARTINGS

23.48 m — LIMESTONE, CALCILUTITE, LIGHT GREY TO MEDIUM GREY, MOTTLED (MEDIUM BLUISH GREY) IN PART, THIN TO THICK BEDDED, ABUNDANT STYLOLITES, CALCITE BLEBS, SHALY (23.17-23.16 m)

27.73 m — SILTY TO SANDY DOLOSTONE, GREENISH GREY TO DARK GREENISH GREY, MEDIUM TO THIN BEDDED

28.95 m — CALCITIC DOLOSTONE, DOLOSILTITE TO DOLOLUTITE, LIGHT GREENISH GREY TO PALE YELLOWISH BROWN, THICK TO THIN BEDDED, STYLOLITES, MINOR GYPSUM (29.31-30.15 m)

30.18 m (cont.)

32.05 m — CALCITIC DOLOSTONE, DOLOSILTITE TO DOLOLUTITE, MEDIUM LIGHT GREY TO PALE YELLOWISH BROWN, LIGHT GREY TO MEDIUM LIGHT GREY LIMESTONE REMNANTS (MOTTLED IN PART), THICK TO THIN BEDDED STYLOLITES, PYRITIC AND GLAUCONITIC

31.58 m — DOLOMITIC LIMESTONE, CALCILUTITE TO CALCISILTITE, MEDIUM LIGHT GREY, THIN TO THICK BEDDED, STYLOLITES, SHALY PARTINGS

35.72 m — SILTY TO SANDY DOLOSTONE, GREENISH GREY TO DARK GREENISH GREY, THICK TO THIN BEDDED, INTRACLASTIC IN PLACES

36.17 m — CALCITIC DOLOSTONE, DOLOSILTITE, GREENISH GREY TO LIGHT GREENISH GREY TO MEDIUM LIGHT GREY, THICK BEDDED

38.71 m — DOLOMITIC LIMESTONE, CALCILUTITE TO CALCISILTITE, MEDIUM LIGHT GREY, THIN TO THICK BEDDED, STYLOLITES, SHALY PARTINGS

39.27 m — SILTY TO SANDY DOLOSTONE, GREENISH GREY, THICK TO THIN BEDDED, SHALY PARTINGS

40.53 m — SLIGHTLY CALCAREOUS QUARTZ SANDSTONE, FINE GRAINED, GREENISH GREY TO DARK GREENISH GREY, THICK BEDDED

41.15 m

Instructions for Completing Form

- For use in the **Province of Ontario** only. This document is a permanent **legal** document. Please retain for future reference.
- All Sections **must** be completed in full to avoid delays in processing. Further instructions and explanations are available on the back of this form.
- Questions regarding completing this application can be directed to the Water Well Management Coordinator at 416-235-6203.
- **All metre measurements shall be reported to 1/10th of a metre.**
- Please print clearly in blue or black ink only.

Ministry Use Only

1.0 Introduction

Ferma Aggregates Inc. (Ferma) has retained MTE Consultants Inc. (MTE) to undertake hydraulic testing to comply with Condition 4.4 of Permit to Take Water (PTTW) 1238-BBLKNE (**Appendix A**). PTTW 1238- BBLKNE permits dewatering of the Carden Quarry located on Lot 6-10, Concession 9, former geographic township of Carden, City of Kawartha Lakes, ON. Additionally Ferma owns W ½ Lot 6 & 7 Concession 10 as well as Lot 8, Concession 10. **Figure 1** illustrates the Site location.

The objective of the hydraulic testing is to characterize the hydraulic properties of the underlying bedrock formations beneath the Site. In order to achieve this objective MTE is proposing to conduct short term pumping tests on discrete bedrock zones at an on-Site monitoring well (MW4). MW4 is located adjacent to Victoria road on Lot 8, Concession 10. The results of this testing will presented in the 2022 Annual PTTW Report.

This report provides support for an Environmental Activity and Sector Registry (EASR) application for a pumping test and discusses in detail the following:

- Proposed short term pumping test;
- Groundwater discharge plan;
- Water resources monitoring plan;
- Potential impacts to groundwater and/or surface water resources during the short term pumping test; and
- Proposed contingency measures.

2.0 Site Setting

2.1 Physiography and Topography

The Site is located within the physiographic region known as the Carden Plain (Chapman and Putnam, 1984). This region generally consists of shallow to outcropping limestone bedrock with a thin layer of overburden. As a result, on-Site elevations are generally flat, laying around 270 metres above sea level (**Figure 2**).

2.2 Surface Water and Drainage

The Site and study area are entirely within the Upper Talbot River subwatershed, which is part of the Lake Simcoe Watershed.

Watercourse mapping indicates that a tributary of the Talbot River flows through the Site (**Figure 2**). On-Site reconnaissance has indicated that only the southern reach of the Talbot River flows year round.

On-Site surface water drainage follows flows into the Talbot River tributary and eventually off-Site at the south-western portion of the Site.

2.3 Local Geology

2.3.1 Quaternary Geology

The Quaternary Geology mapping of the Site indicates much of the Site is outcropping Paleozoic bedrock. There is a small pocket of till located in the southeast corner of the Site, a pocket of organic deposits associated with a wetland in the central portion of the Site, and a

coarse-textured glaciolacustrine deposit running from the center to the west of the Site that is associated with the on-Site creek (**Figure 3**) (Finamore & Bajc, 1982).

2.3.2 Bedrock Geology

The underlying bedrock is composed of Ordovician age carbonates and shales of the Simcoe Group overlying the Precambrian basement. The Ordovician age carbonates can be subdivided into three formations (from oldest to youngest): Shadow Lake Formation, Gull River Formation, Bobcaygeon Formation. In general, these formations dip to the southwest.

Shadow Lake Formation

The Shadow Lake formation consists of a non-fossiliferous, arkosic siltstone, argillaceous sandstone conglomerate (Armstong, 2000).

Gull River Formation

The Gull River formation consists of fossiliferous, micritic limestone and dolostones (Armstong, 2000). The Gull River Formation contains features locally referred to as the green marker beds. These beds are approximately 1-3 m in thickness and are laterally extensive across the Carden Plain. These features have been reported to represent a regional aquifer (Golder Associates, 2016).

Bobcaygeon Formation

The Bobcaygeon formation overlies the Gull river formation and consists of fossiliferous course grained limestone and can be subdivided into the upper, middle and lower unit (Armstong, 2000).

2.4 Local Groundwater Use

Local area residents within the vicinity of the Site obtain water from private drilled supply wells. Based on a review of the MECP well records and Site reconnaissance, private wells are generally screened within the shallow bedrock of the Bobcaygeon formation. Additionally, the MECP database indicates that, apart from wells owned by the Client, there are no private wells within 500 m of the pumping well (MW4) (**Figure 4**). However, MTE notes there are eight private wells within 1500 m of the pumping well (MW4) (**Figure 4**). Details of private wells constructed within 1500 m of the pumping well (MW4) have been compiled from well records on file with the MECP, and are available in **Table 1**.

3.0 Pumping Test Program

Two separate intervals will be isolated in MW4 using a packer system for hydraulic testing. The intervals will be individually pumped at a maximum rate of 11.4 L/s (150 IGPM). For testing purposes MTE has separated the bedrock into three distinct zones. The “lower zone”, defined as being below the green marker beds with the Gull River Formation, a “middle zone” which is defined as the area between and including the green marker beds and a “upper zone” above the two green marker beds primarily consisting of the Bobcaygeon formation.

Step one: Install a packer such that the lower zone is hydraulically isolated, and pump at various rates to determine optimal pumping rate for testing in step 2;

Step two: Pump the lower zone at a continuous rate (not exceeding 11.4 L/s) for approximately eight hours, and measure drawdown in the lower zone.

Step three: Install a straddle packer such that the middle zone is hydraulically isolated and pump at various rates to determine optimal pumping rate for testing in step four, and;

Step four: Pump the middle zone at a continuous rate (not exceeding 11.4 L/s) for approximately eight hours, and measure drawdown in the middle zone and the upper zone.

The proposed combined maximum taking has been summarized below.

Source Name	Maximum Pumping Rate (L/min)	Maximum Number of Hours of Taking per Day	Maximum Pumping Volume (m^3/day)	Typical Pumping Volume (m^3/day)	Maximum Number of Days of Taking
MW4	682	24*	982	982	4

*Individual pumping tests for step 2 and step 4 are anticipated to last between 8-12 hours.

3.1 Monitoring Plan

Monitoring of groundwater levels will occur across the Site at select monitoring wells. These monitoring locations have been selected based on their proximity to the pumping well (MW4) and their screened interval. Monitoring of these locations will allow responses to pumping to be monitored within the various bedrock aquifers. Additionally, one private well (W4) located approximately 1100 m southeast of the pumping well (MW4) will be monitored on a daily basis and will have a data logger programmed to take readings every 60 minutes for the duration of the pumping test.

The table below outlines the locations to be monitored, the bedrock formation that the screen is installed in, and the data logger recording interval.

Monitoring Location	Approximate Distance from MW4 (m)	Screened Aquifer	Data Logger Recording Interval (min)
MW3	100	Bobcaygeon	5
MW1	710	Bobcaygeon	5
MW2b	740	Bobcaygeon	5
WAc	1,100	Gull River	5
WBc	1,100	Gull River	5
W22a	2,060	Upper Green Marker Bed (Gull River)	1
W22b	2,060	Lower Green Marker Bed (Gull River)	1
W4	1,100	Bobcaygeon	60

3.1.1 Data Loggers

During the pumping tests, select monitoring locations will be equipped with dedicated pressure transducers (data loggers) to record water levels at regular intervals.

From the commencement of pumping, data loggers within the selected monitoring locations will be programmed to collect a water level every 5 minutes, with the exception of W22a and W22b. The two nested wells at W22 are the only wells on-Site screened across the green marker beds. As such, data logger readings will be taken on one minute intervals at these two wells.

Following the conclusion of the pumping test, data loggers will be programmed to collect a water level every hour for a minimum of seven days to record recovery data.

3.1.2 Manual Measurements

Manual measurements at MW4 and select on-Site monitoring wells will be collected on a daily basis.

3.2 Groundwater Discharge Plan

Water pumped from MW4 will flow through a discharge pipe with an in-line flow meter (totalizer) and will be discharged though an orifice weir approximately 250 m to the southeast of MW4. Discharge water will be allowed to follow the existing roadside ditch down Victoria Road towards McNamee Road (**Figure 5**). South of McNamee road, an unnamed stream flows southwest through a topographic low, and ultimately empties into Canal Lake. Hay bales will be placed in the roadside ditch along Victoria Road to reduce flow/erosion and increase infiltration. As such, water from the pumping test will be discharged in such a manner as to not cause adverse impacts to the environment and at a distance which will not interfere with the results of the pumping test.

Discharge water will be sampled during Step 2 and Step 4 and will be analyzed for parameters including general chemistry and hydrocarbons.

4.0 Potential Impacts and Proposed Contingency Measures

4.1 Potential Impacts

4.1.1 Private Supply Wells

A contingency plan has been prepared to ensure that a reliable and continuous water supply is maintained should any potential interference cause an adverse effect at a local private supply well during the short-term pumping test. Details of the contingency plan have been provided in **Section 4.2**.

4.1.2 Natural Features

Based on the limited duration and discrete nature of the hydraulic testing, MTE does not anticipate any impacts to surrounding natural features. As discussed in **Section 3.2**, water from the pumping test will be discharged into an existing roadside ditch, and hay bales will be used to assist in dissipating the energy and mitigating potential increases to erosion and downstream total suspended solids.

4.2 Proposed Contingency Measures

4.2.1 Private Well Interference

Prior to the first day of the short term pumping test (approximately 48 hours), MTE will distribute a notice to private well owners within 1,500 m of MW4 (**Figure 4**). The notice will include the anticipated date, start time, and duration of the pumping test.

In addition, the notice will include a 24-hour contact number should a resident have any problems or concerns during the pumping test.

Should MTE be notified of a resident experiencing any adverse effects to their domestic well a licensed well contractor/pump installer, along with a qualified MTE representative, will be dispatched to the location of the complaint to provide corrective action. If required, the licensed well contractor will be able to disconnect the owner from their well and supply water via a temporary water storage tank for the duration of the short-term pumping test.

5.0 Limitations

Services performed by **MTE Consultants Inc.** (MTE) were conducted in a manner consistent with the level of care and skill ordinarily exercised by members of the Environmental Engineering & Consulting profession. No other warranty or representation expressed or implied as to the accuracy of the information, conclusions or recommendations is included or intended in this report.

This report was completed for the sole use of MTE and the client. It was completed in accordance with the Scope of Work referred to in Section 1.0. As such, this report may not deal with all issues potentially applicable to the Site and may omit issues, which are or may be of interest to the reader. MTE makes no representation that the present report has dealt with any and all of the important features, including any or all important environmental features, except as provided in the Scope of Work. All findings and conclusions presented in this report are based on Site conditions as they existed during the time period of the investigation. This report is not intended to be exhaustive in scope or to imply a risk-free facility.

Any use which a third party makes of this report, or any reliance on, or decisions to be made based upon it, are the responsibility of such third parties. MTE accepts no responsibility for liabilities incurred by or damages, if any, suffered by any third party as a result of decisions made or actions taken, based upon this report. Others with interest in the Site should undertake their own investigations and studies to determine how or if the condition affects them or their plans.

It should be recognized that the passage of time may affect the views, conclusions and recommendations (if any) provided in this report because environmental conditions of a property can change. Should additional or new information become available, MTE recommends that it be brought to our attention in order that we may re-assess the contents of this report.

Should you have any questions or concerns, please do not hesitate to contact us.

Respectfully Submitted,

MTE Consultants Inc.
